

**Land Abandonment in Russia:
Understanding Recent Trends and Assessing Future
Vulnerability and Adaptation to Changing Climate
and Population Dynamics**

End date: January 2013

Land Abandonment & Agricultural Development

**But most of all,
this is a story about people.**

Overview

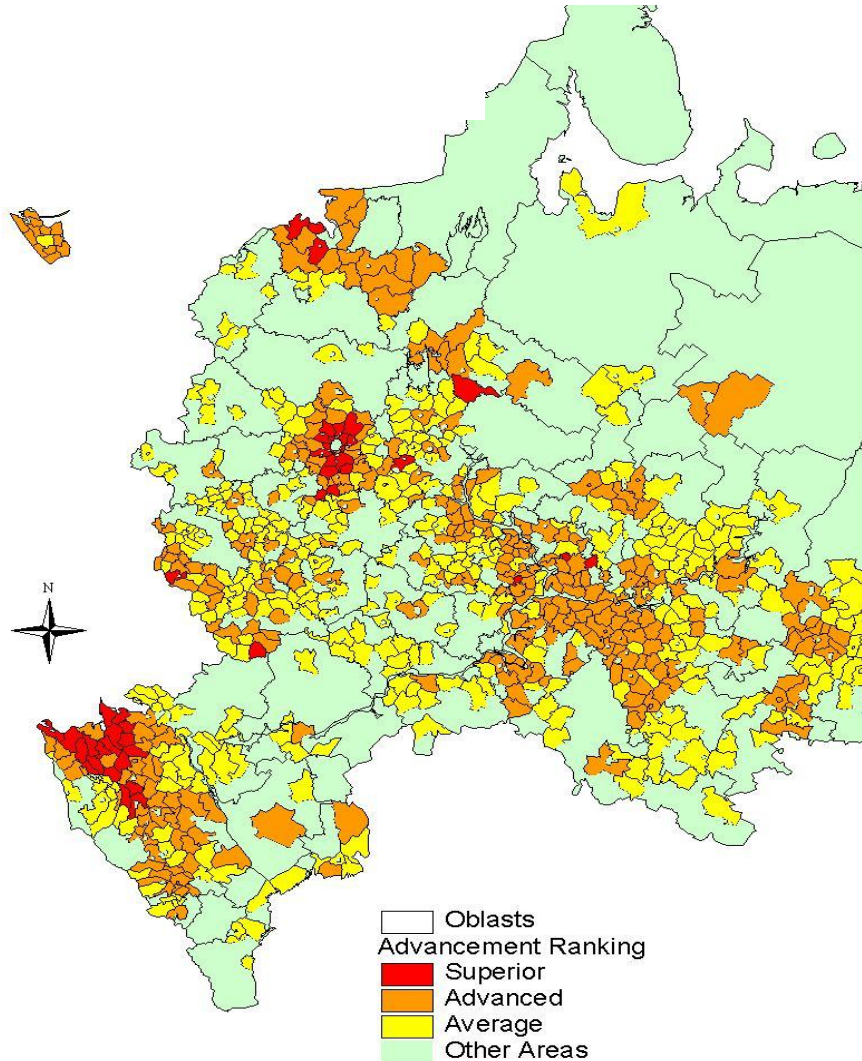

- Introduction to our study
- Results from the first 20 months of our project
– abandonment AND resurrection
- An example of climate adaptation and land use monitoring (instead of only land cover)

Introduction

- Interdisciplinary project in land change science: integrating social, geographical, climate and remote sensing sciences.
- Goal: improve the current understanding of the interaction of climate change and the spatio-temporal impacts of agricultural reform in Russia.

Emerging Archipelago of Commercial Farming 1990 - 2000

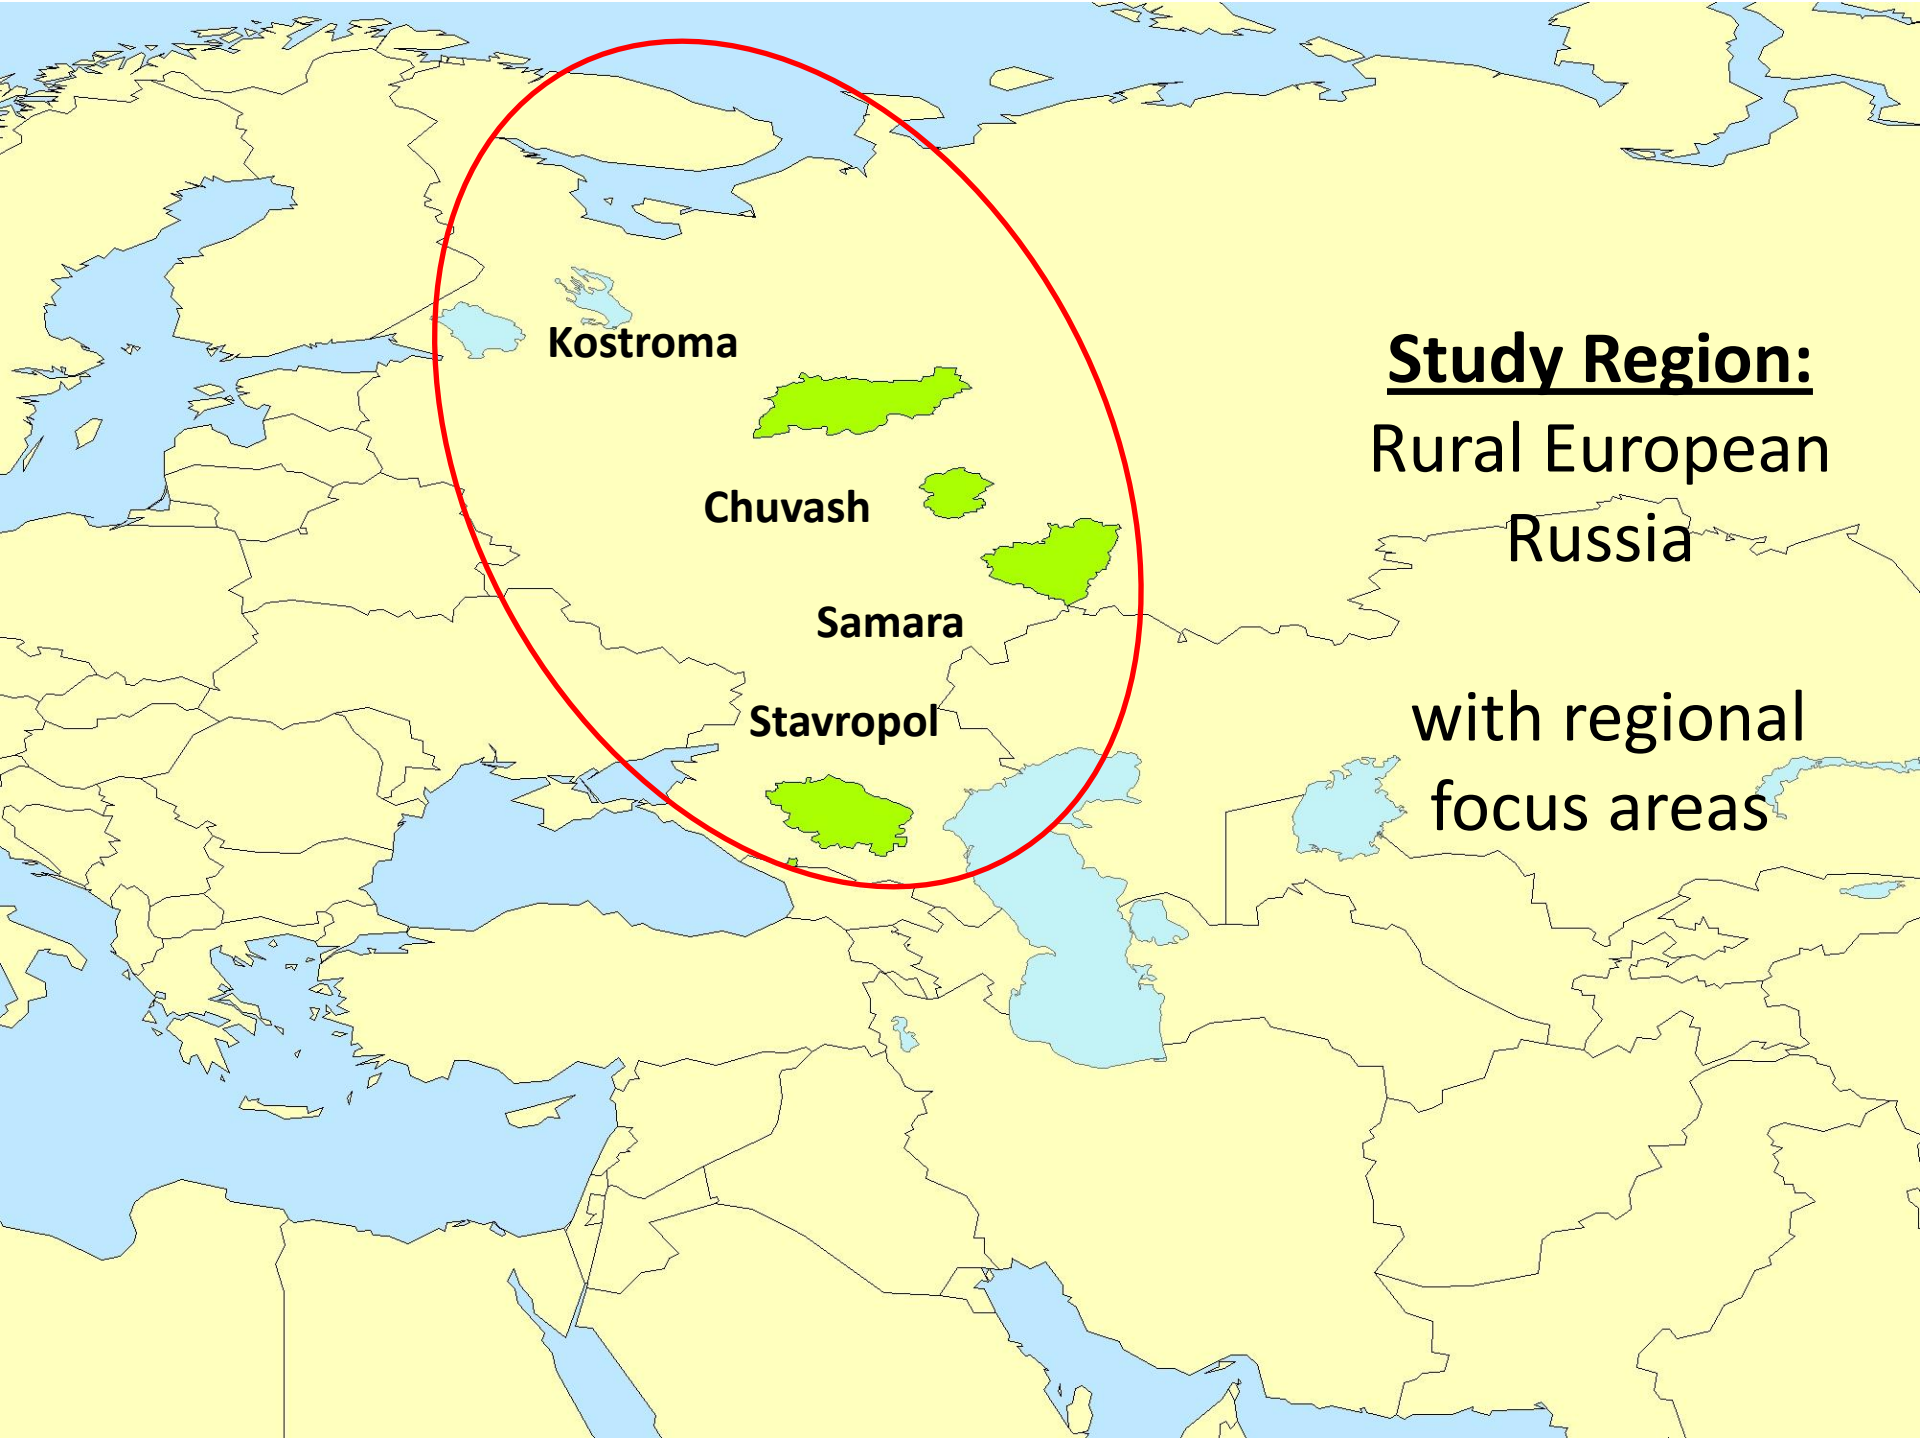

Successful farming can be found in:

- Southern oblasts
- Urban suburbs
- National republics of the Volga and Ural regions

2010: How are things now?

Adaptation to markets & climate

Kostroma

Chuvash

Samara

Stavropol

Study Region:
Rural European
Russia

with regional
focus areas

Results Summary

Advanced Abandonment

Drivers: environment, soils, aging population, proximity to cities

Production: grain

Kostroma

Mixed results

Drivers: soils, ethnicity, proximity to cities

Production: potatoes, grain

Chuvash

Samara

Stavropol

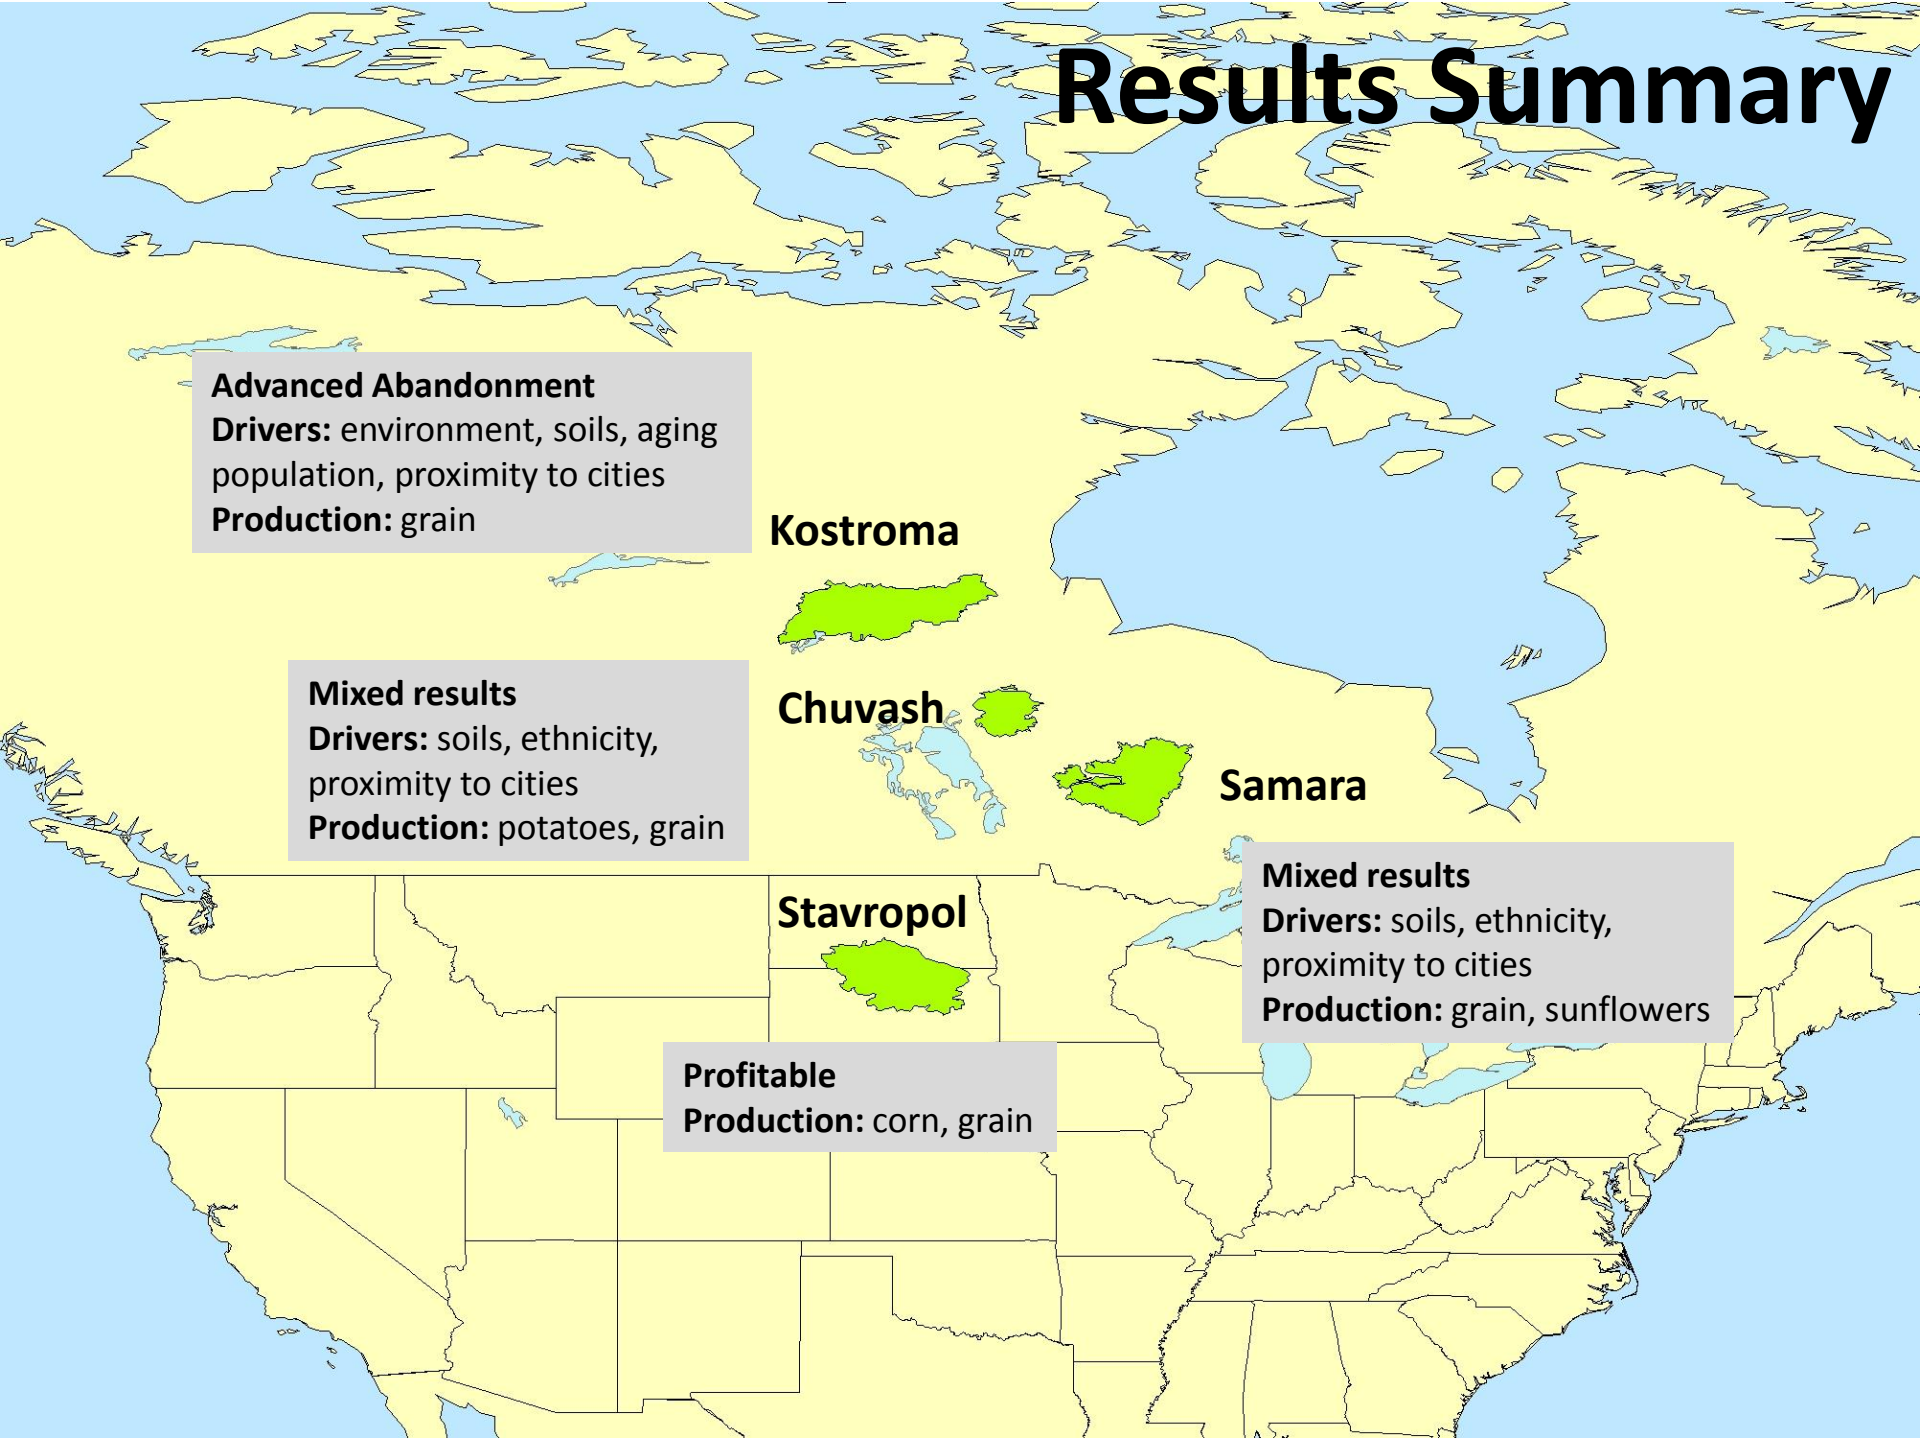

Mixed results

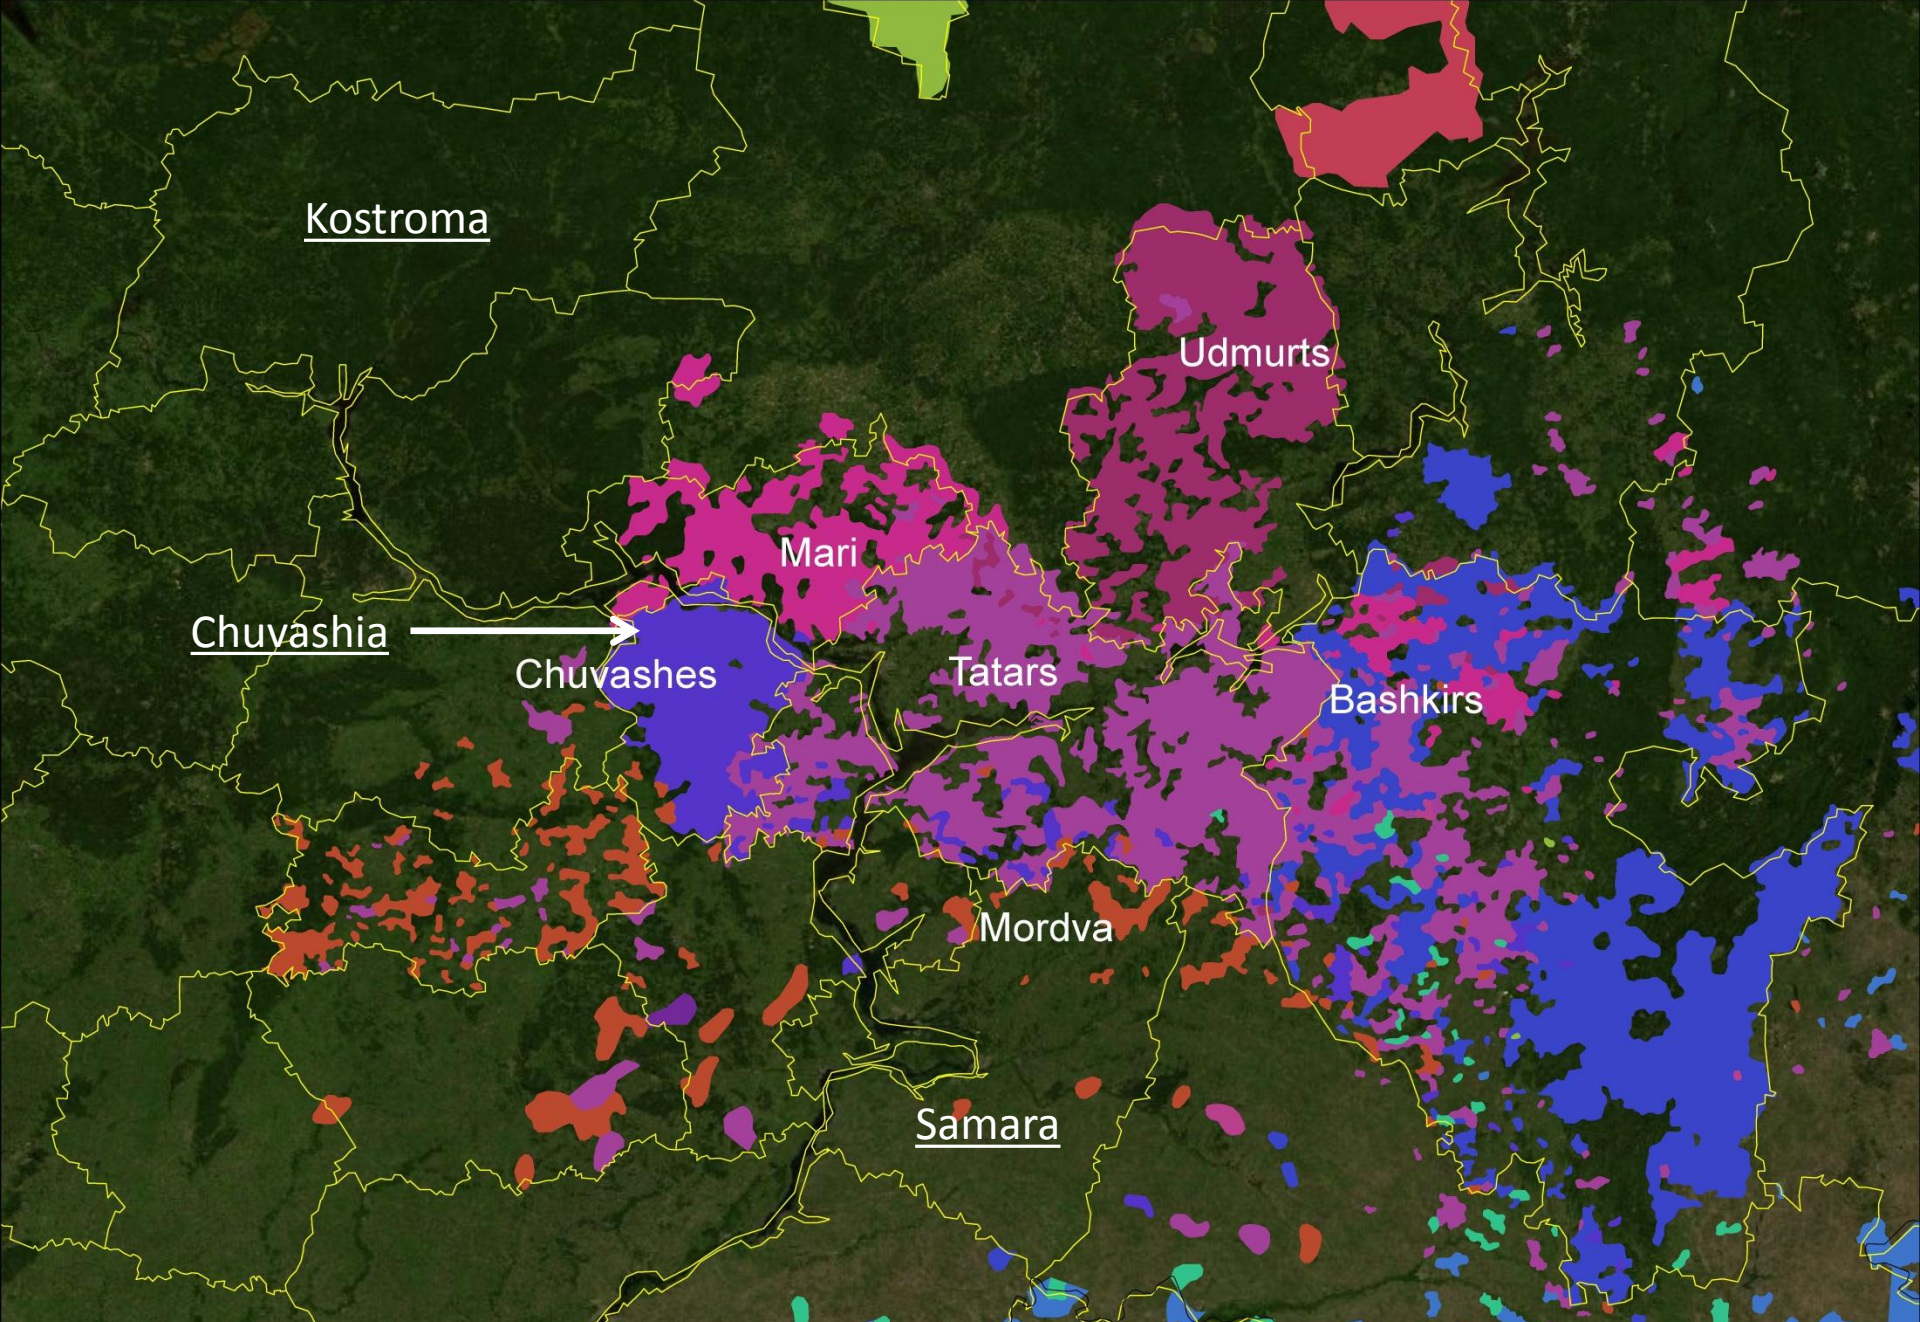

Drivers: soils, ethnicity, proximity to cities

Production: grain, sunflowers

Profitable

Production: corn, grain

Weidmann, Nils B., Jan Ketil Rød and Lars-Erik Cederman (2010). "Representing Ethnic Groups in Space: A New Dataset". Journal of Peace Research.

Field Methods

- We visited typical settlements and enterprises in 4/5 selected *subdistricts* within each of the 4 selected study regions.
- Among the people we interviewed were:
 - the head of each selected rayon
 - the chief of agriculture of each selected rayon
 - the heads of *at least* 3 different farms
 - the administration heads of the corresponding villages

In addition:

- The ministers economics and agriculture in Samara oblasts
- Several faculty members of the department of Geography at Chuvash Republic University
- Agronomists and other agricultural specialists in Samara, Chuvash and Stavropol

- In total we performed between 20 and 30 interviews per region (4).
- Each interview lasted between thirty and ninety minutes.
- The interviews were typically attended by one to five respondents.
- Among the farmers and administrators interviewed, there were people from Bashkir, Tatar and Chuvash ethnicities.
- Interviews took place in May/June 2010, June 2011 and September 2011.
- We also visited regional statistical offices to update data collected in 2000.

Kostroma Oblast

- Abandonment is advanced.
- Many villages are abandoned completely.
- Others have only a few elderly people left.

Stavropol Krai

- Krasnodar and Stavropol (along with Moscow and Leningrad) have the best collective enterprises in Russia, with high productivity of land and livestock.
- Despite the 2008-2010 financial crisis and last year's drought enterprises still survive.
- Stavropol is second in Russia with respect to grain production (behind Krasnodar).
- There are some abandoned areas on the plains of the North Caucasus but it is far less than in other regions of Russia.

Kostroma

**Mixed results.
Why?**

Chuvash

Samara

Stavropol

Samara Agriculture

- Since 1997, agriculture is growing (except in 1998).
- Agriculture area is gradually emerging from the crisis, but it is changing its sectoral and territorial structure.
- There was a clear shift from livestock to crop farming:
 - the proportion of crop growing in the Samara region rose from 41% in 1991 to 60% in 2003.
 - cattle loss from 1,012,000 to 212,000
- Adaptations to climate and new markets are ongoing.

Land Cover

Reference Data		
		UAC
Classified	Water	0.938
	Forest	0.963
	Grassland	0.555
	Cropland	0.918
	Urban	0.722

Overall Accuracy: 0.862
Kappa Coefficient: 0.8017

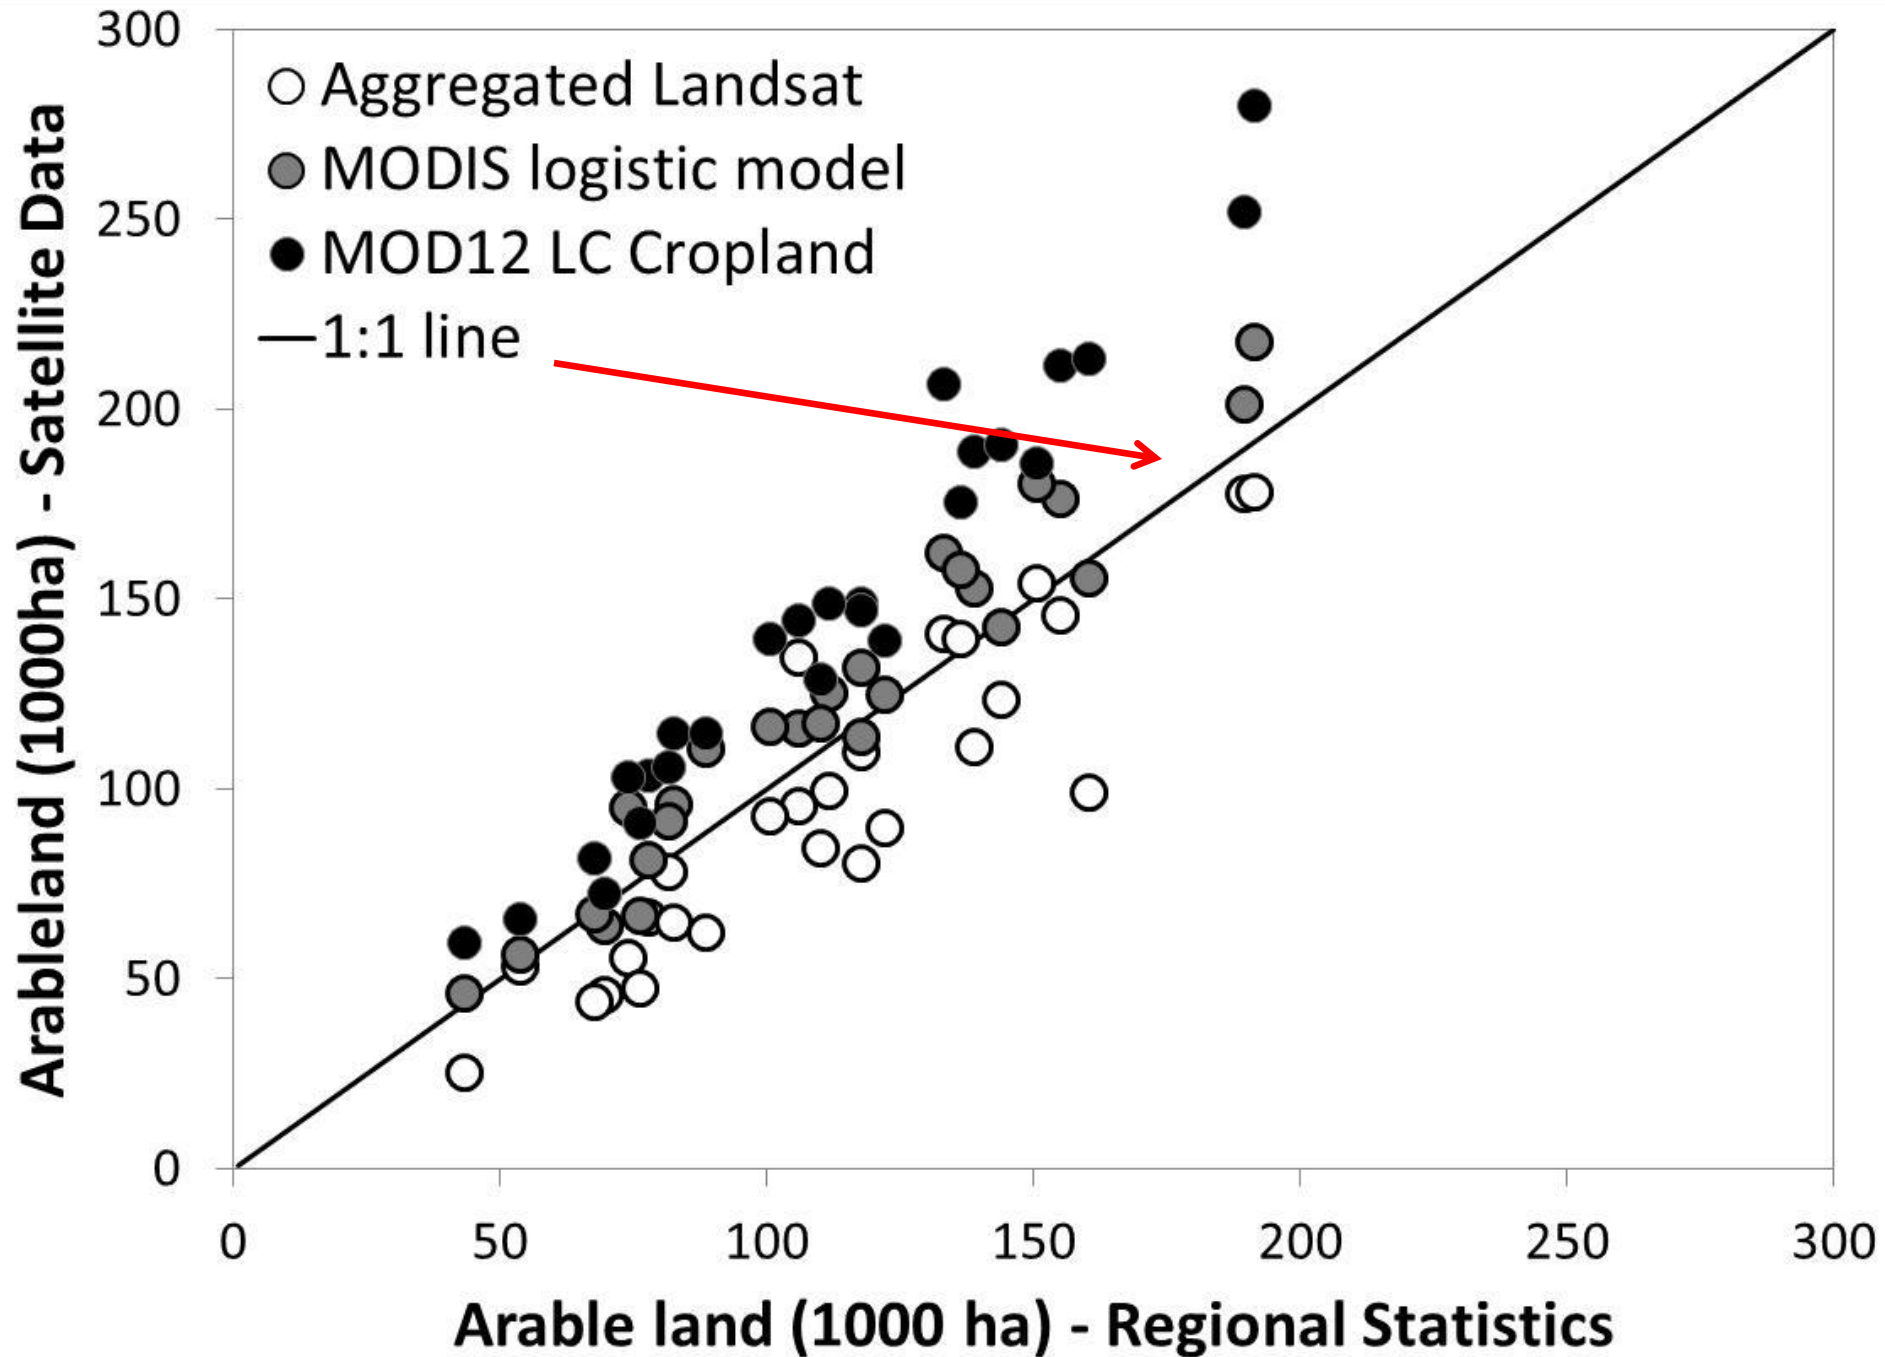

Logistic model

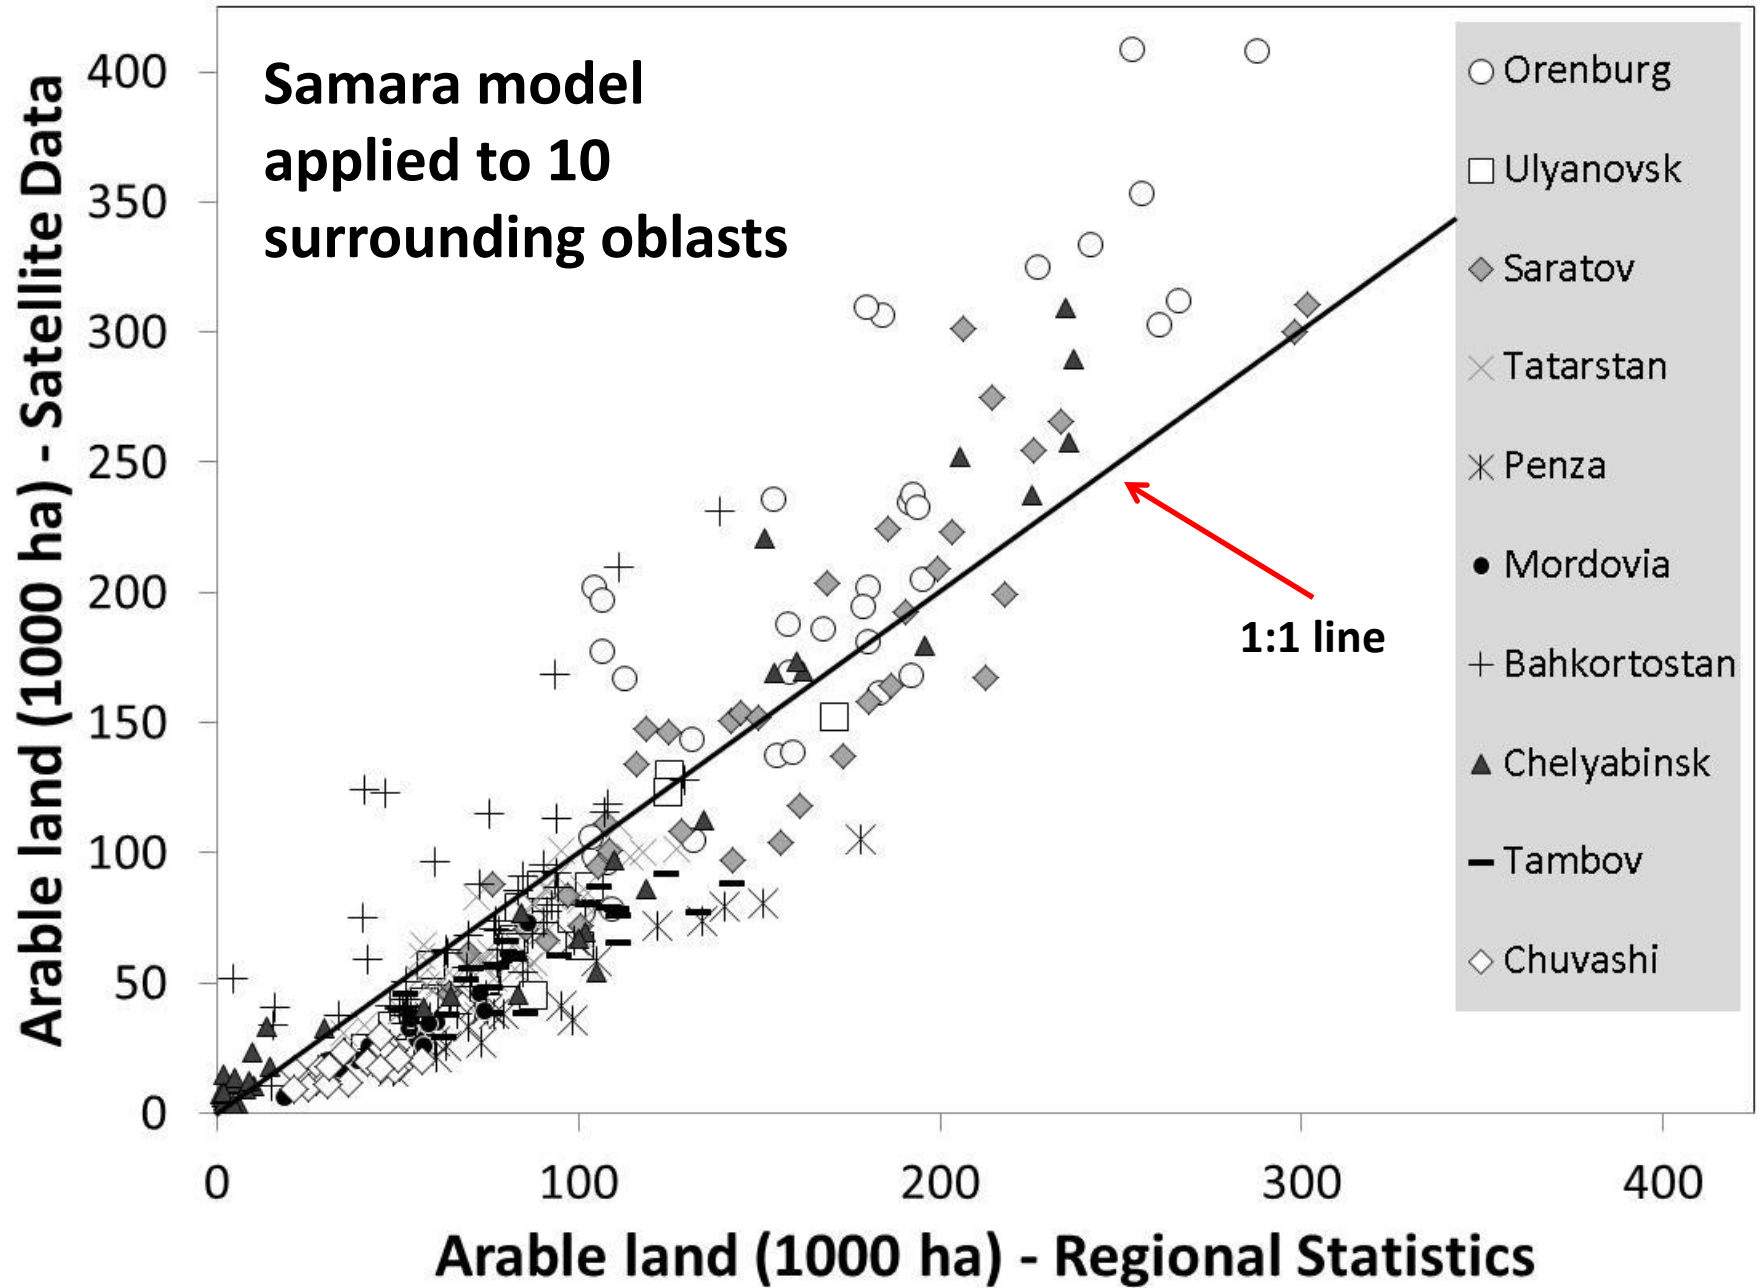

- Model to link land surface phenology estimates based on MODIS with Landsat based land cover estimates.
- Use phenology measurements to understand if cropland is actually cropped for a particular year.

	% Correct	AUC	Cohen's Kappa
Forest	0.93	0.94	0.92
Cropland	0.70	0.83	0.59

0 25 50 100 Kilometers

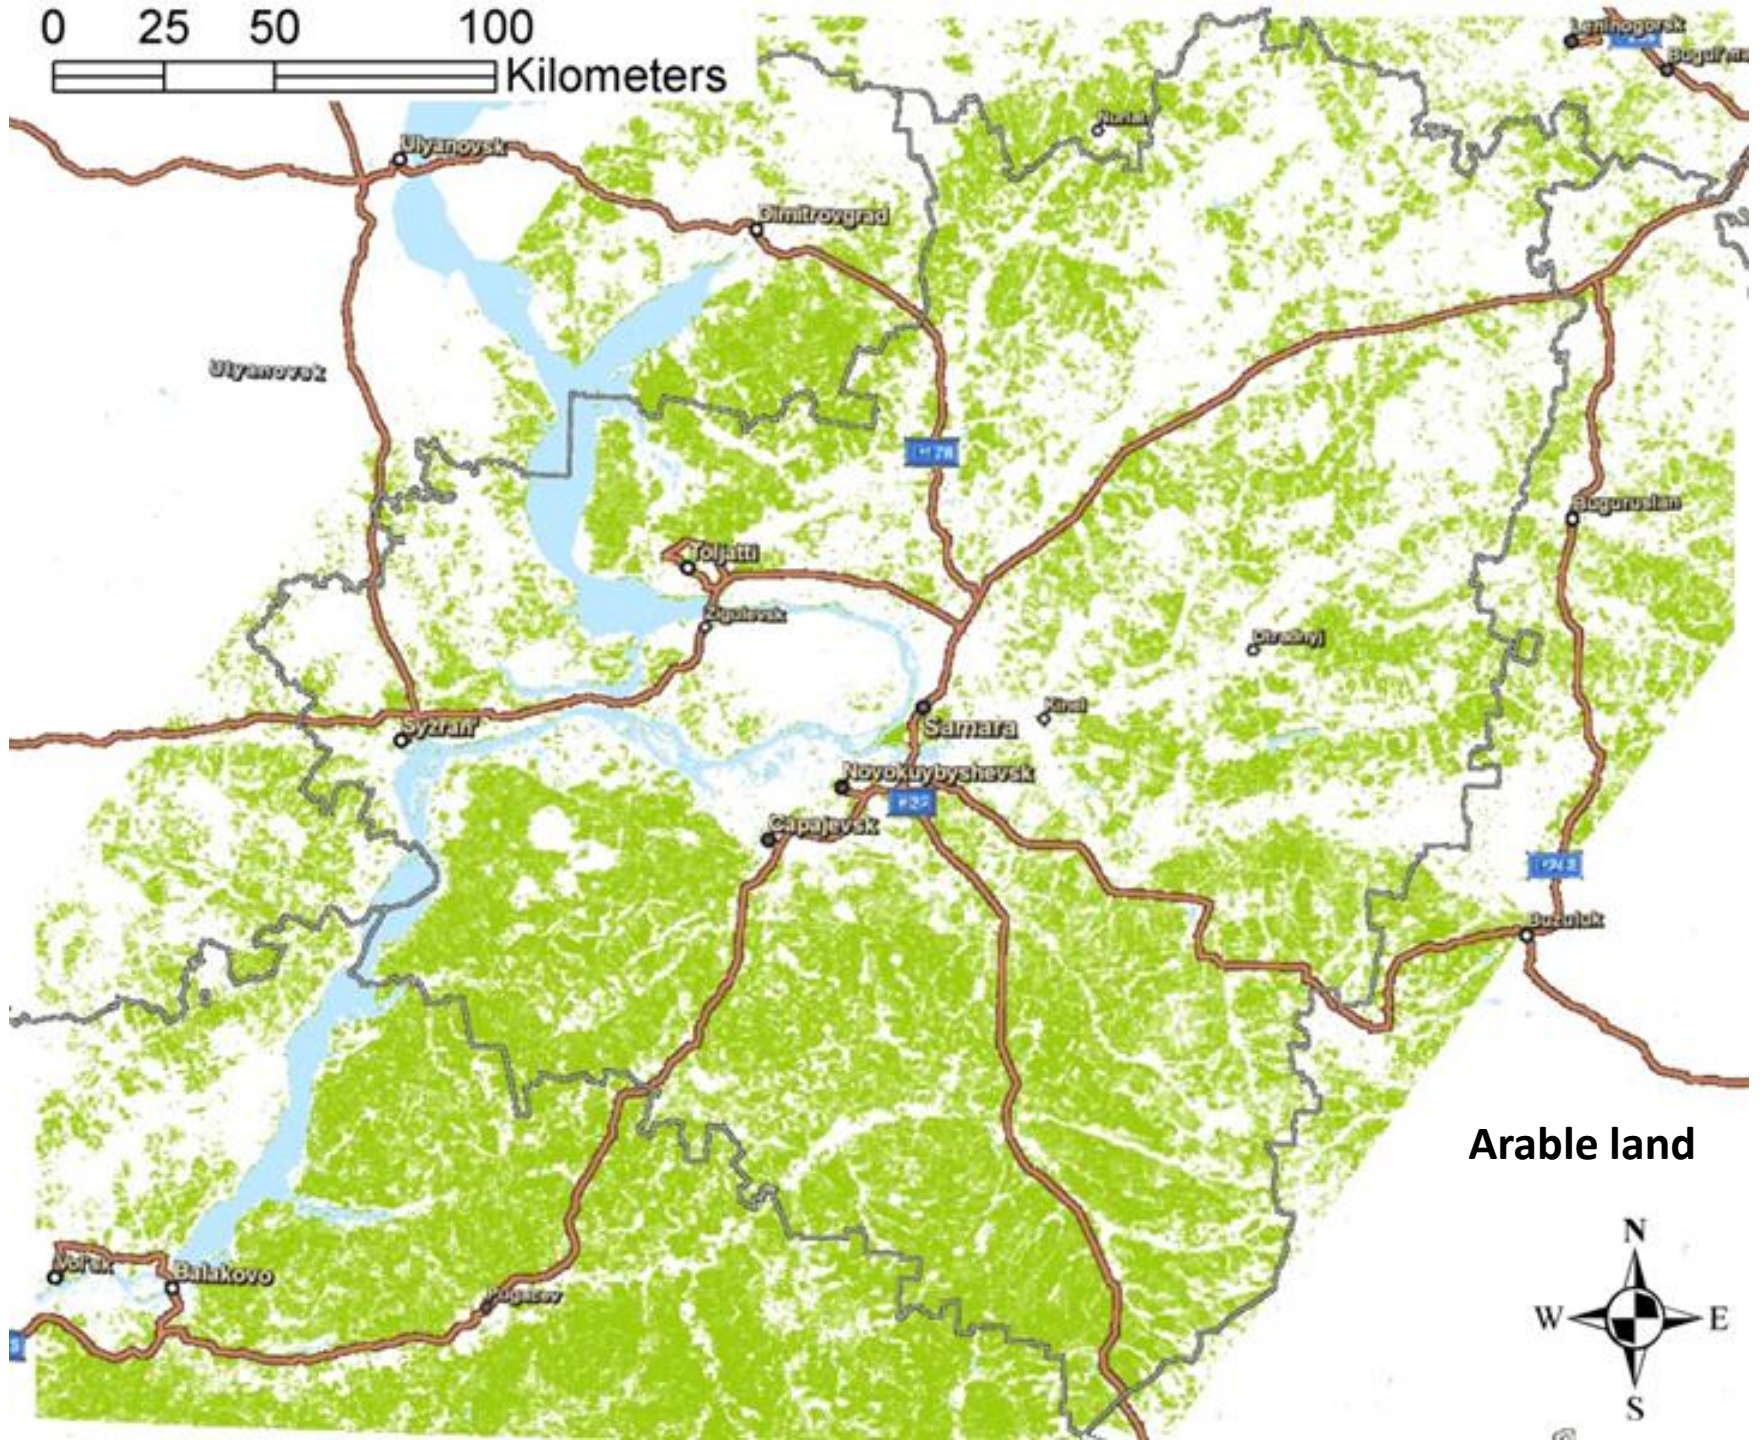

Land Cover vs. Land Use

- Integrated assessment models typically target large areas.
- However, decision-makers increasingly want to understand the effect of climate change and policy changes in regional areas.
- For ***regional*** integrated assessment models it is even more important to focus on land use instead of land cover.
- Besides understanding whether an area is considered cropland, it is important to know whether the cropland is actually used and if so in what way.
- First step → how often is an area successfully cropped?

0 25 50 100 Kilometers

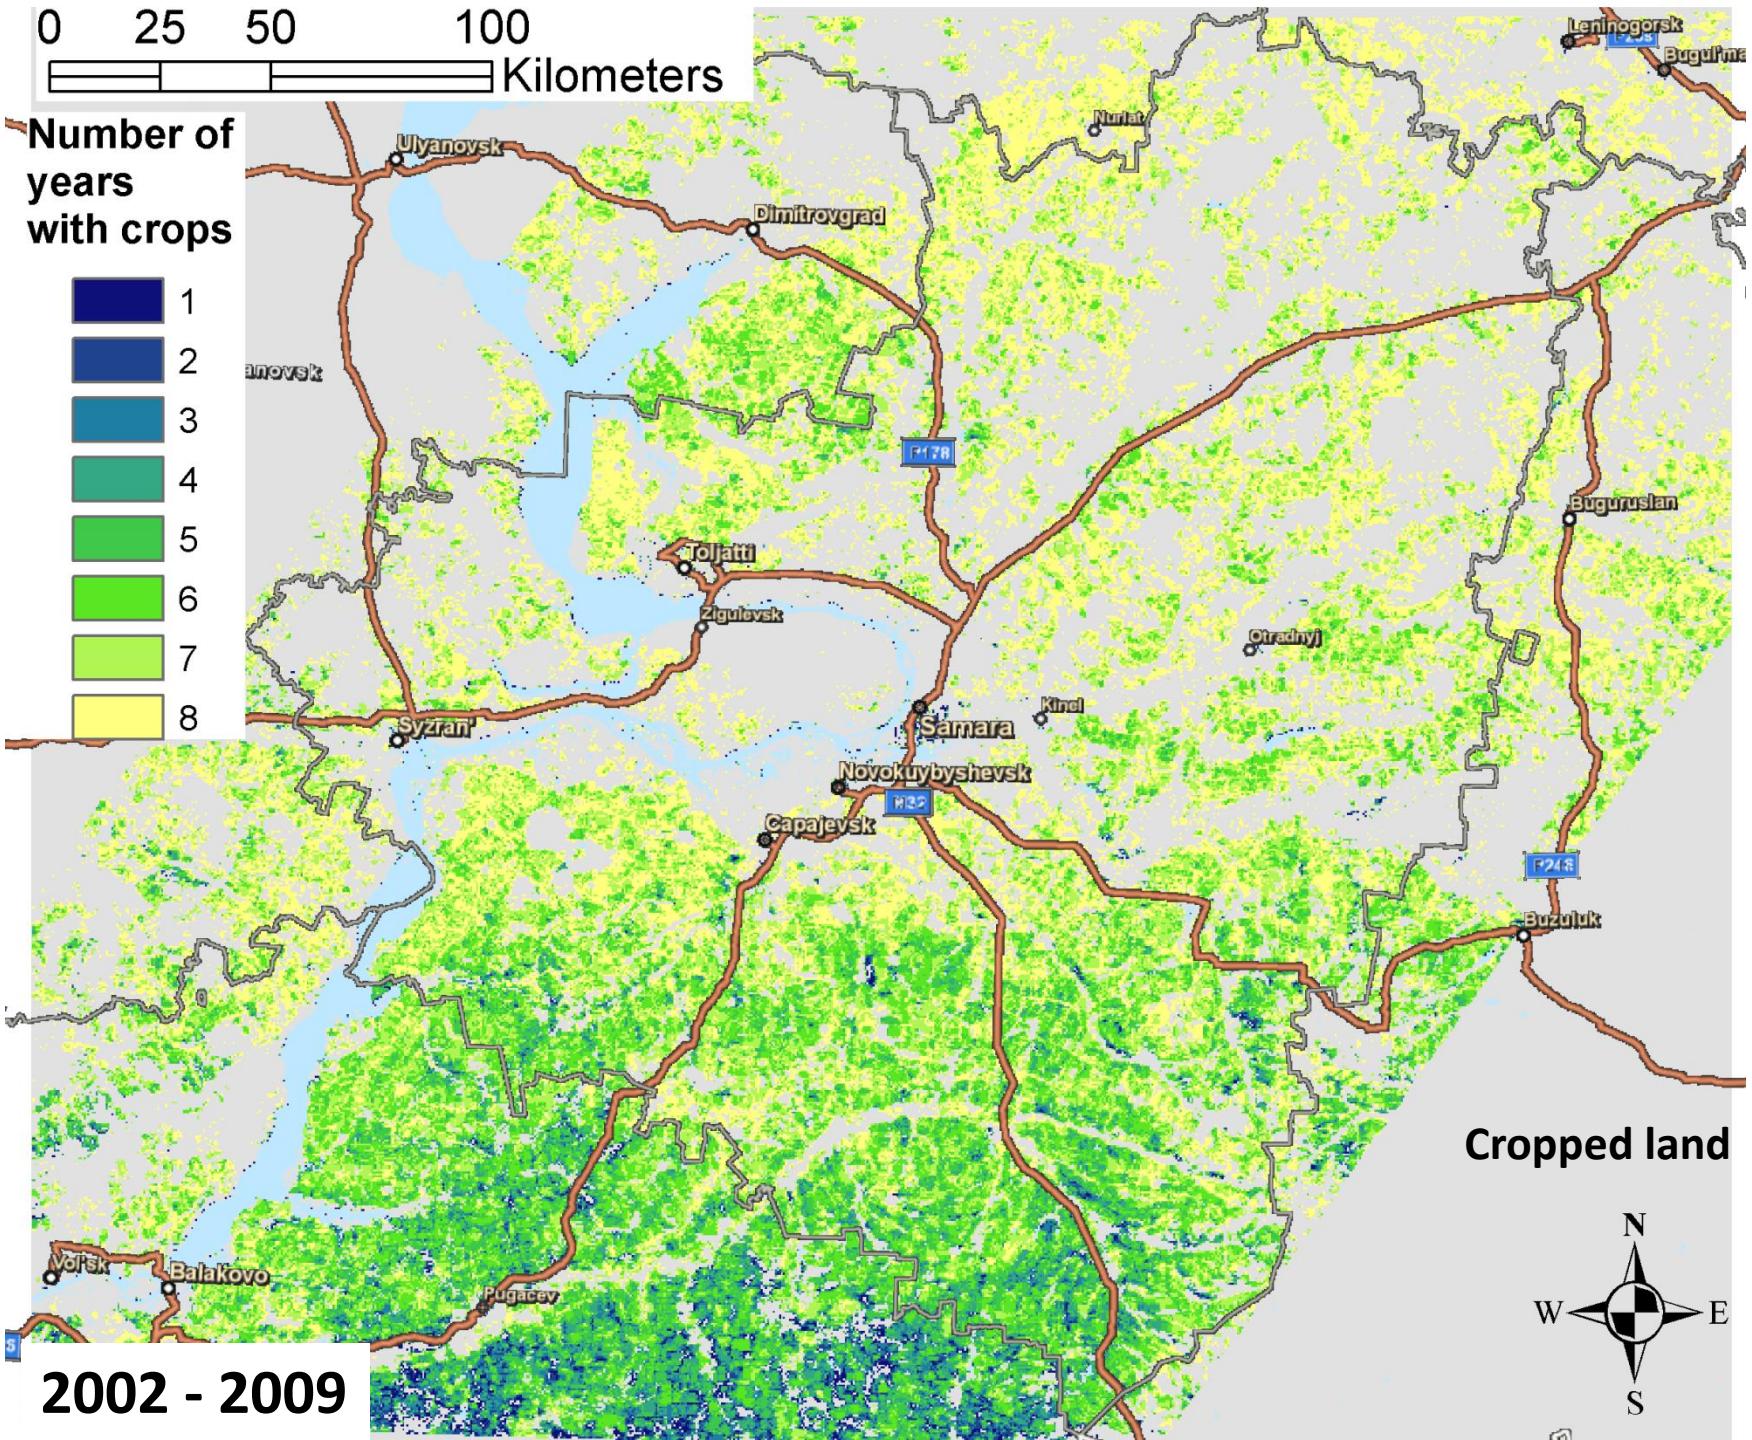

Arable land

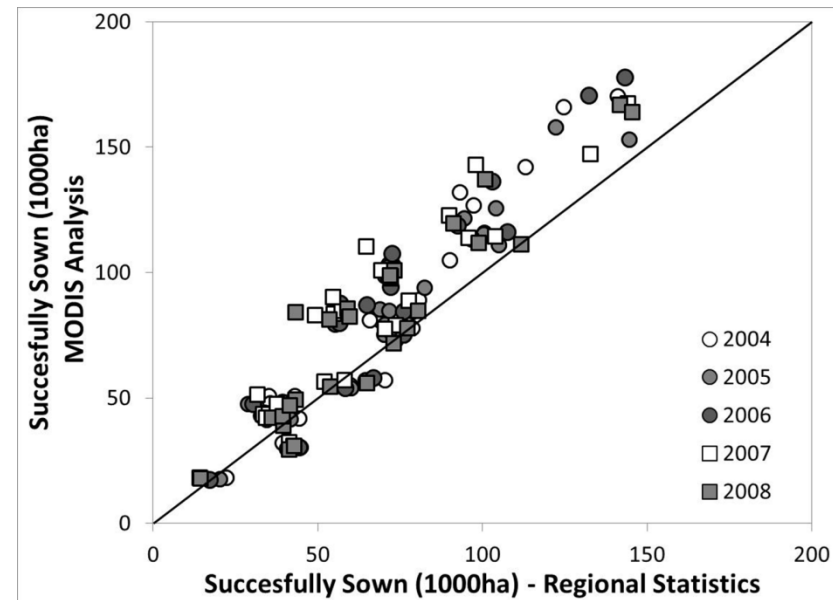

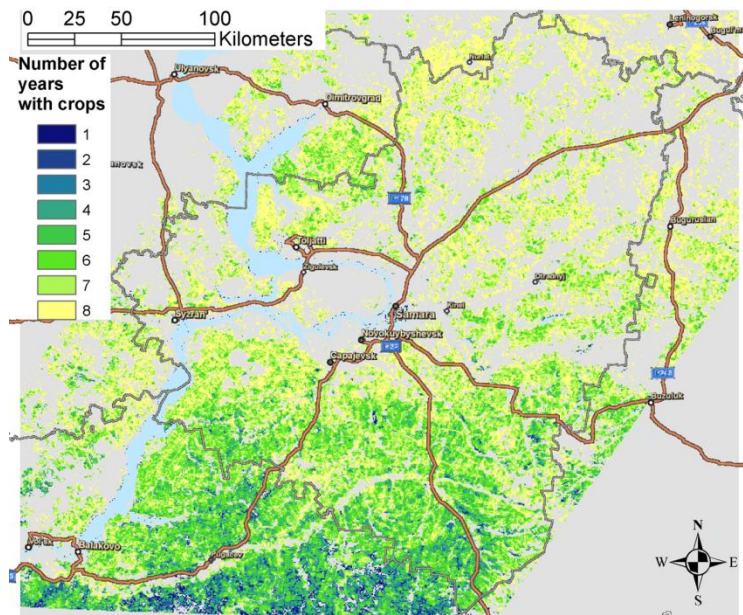

0 25 50 100 Kilometers

Number of years with crops

2002 - 2009

	Successfully Sown Land			
	Intercept (1000 ha)	Slope	R^2_{adj}	RMSE (1000 ha)
2004	-11.451*	1.331	0.915	12.215
2005	-3.856*	1.189	0.906	11.732
2006	-3.944*	1.271	0.899	13.423
2007	6.984*	1.156**	0.857	14.979
2008	1.646*	1.160**	0.864	14.916
Overall	-1.457*	1.213	0.884	13.578

*: not significant different from 0 ($p = 0.05$).

** : not significantly different from 1 ($p = 0.05$).

Why is this important?

- Shorter-term climate adaptations include changing crop season (e.g., winter vs. spring grains), cultivars, and sowing dates (IPCC and citations therein, 2007).
- Farmers in Samara previously:
 - 7-year crop rotation → variety of grain + 1 year fallow.
- Now, crop rotation schedules are changing:
 - 3- year crop rotation → fallow-grain-sunflower.
- Also switch is underway: spring wheat → winter wheat and to grow different products such as chickpeas.

Winter Wheat or Spring Wheat?

- Winter wheat: lower seed and herbicide costs + higher yields.
- Production risks are the major concern → winter kill.
- In North Dakota: **winter** wheat abandonment has decreased from 18% to 13%. **Spring** wheat abandonment has been between 4 and 5%.
- Most hardy varieties:

Temperature (°C)	Maximum Length (days)
-3	150.0
-15	6.0
-26	0.5
-29	0.0

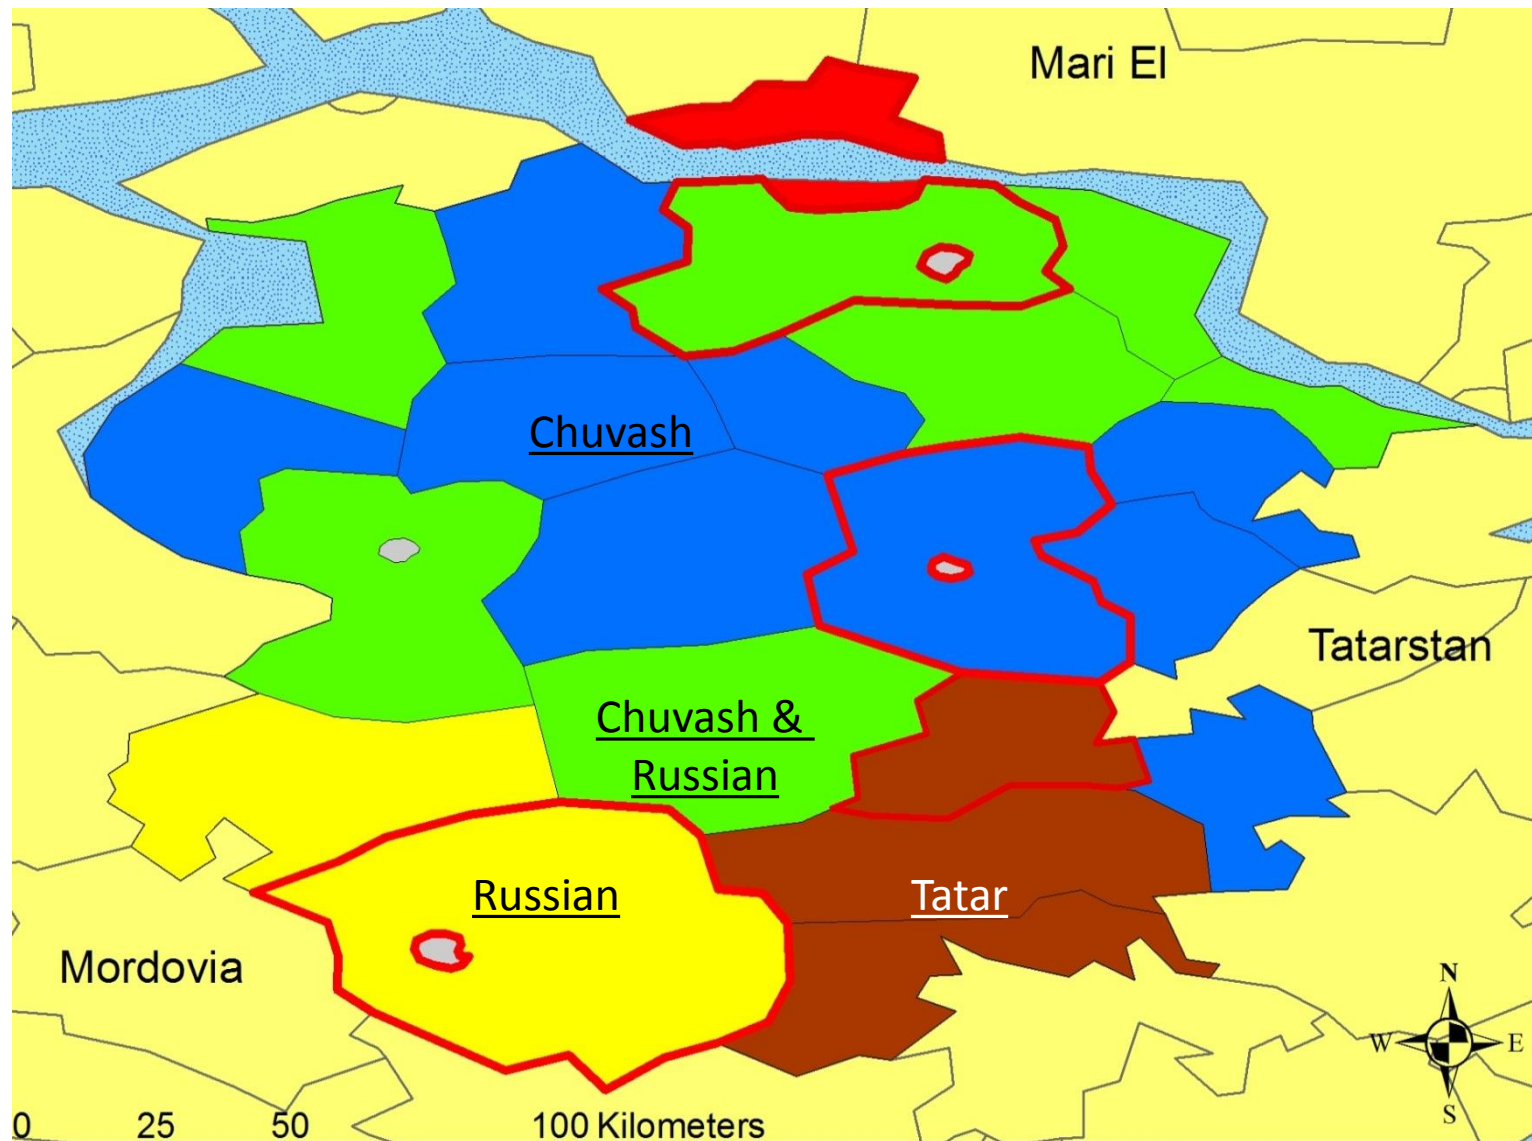

Abandonment? No, Resurrection!

Preliminary results from Chuvash Republic

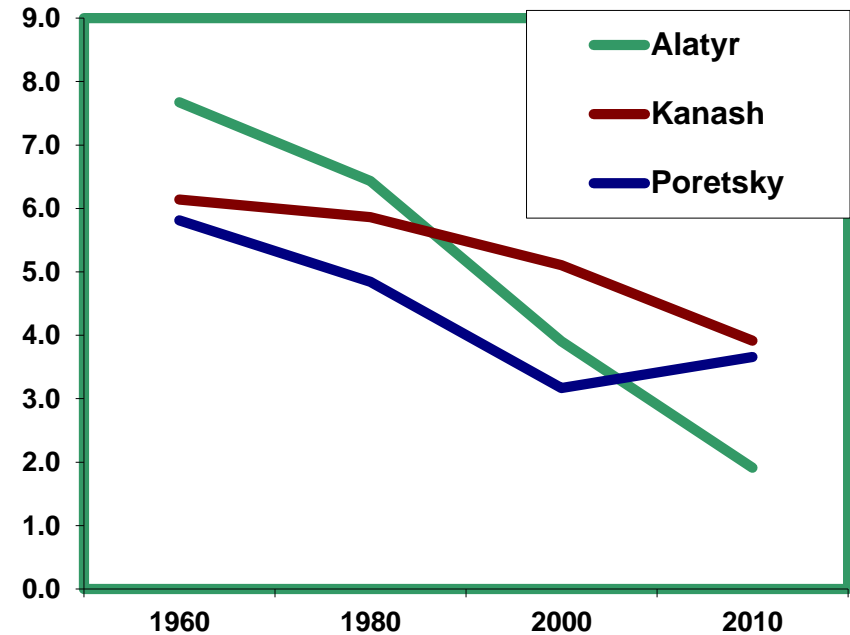

National Composition of the population of Chuvash Republic

Years	Cheboksary	Krasnoche taysky	Kozlowski	Alatyr	Poretsky	Komsomol
		Chuvash		Russian		Tatar

**Milk production
(proportion of contribution to
Republic)
from 1960 to 2010**

Tatar owners, established in 2007 based on an old collective farm bought in an auction that they greatly remodeled.

- Mother company is in Tatarstan (13,000ha).
- The owner invested 1 billion rubles (~ \$30 million).
- Sale: 2000 - 2500 pigs per week.
- Most of their work is automated → 100 employees.
- They also grow 500 hectares of winter grains (since 2011). In the near future they aim to grow another 1500 hectares.

СЛАВА КАРТОФЕЛЮ

Служить **ЗЕМЛЕ**
всегда везде!

- Farm started 10 years ago.
- They have also spread into other regions.
- 5000 ha of potatoes.
- Last year's harvest (despite drought) was 30 MTs.
- They employ ~100 people.

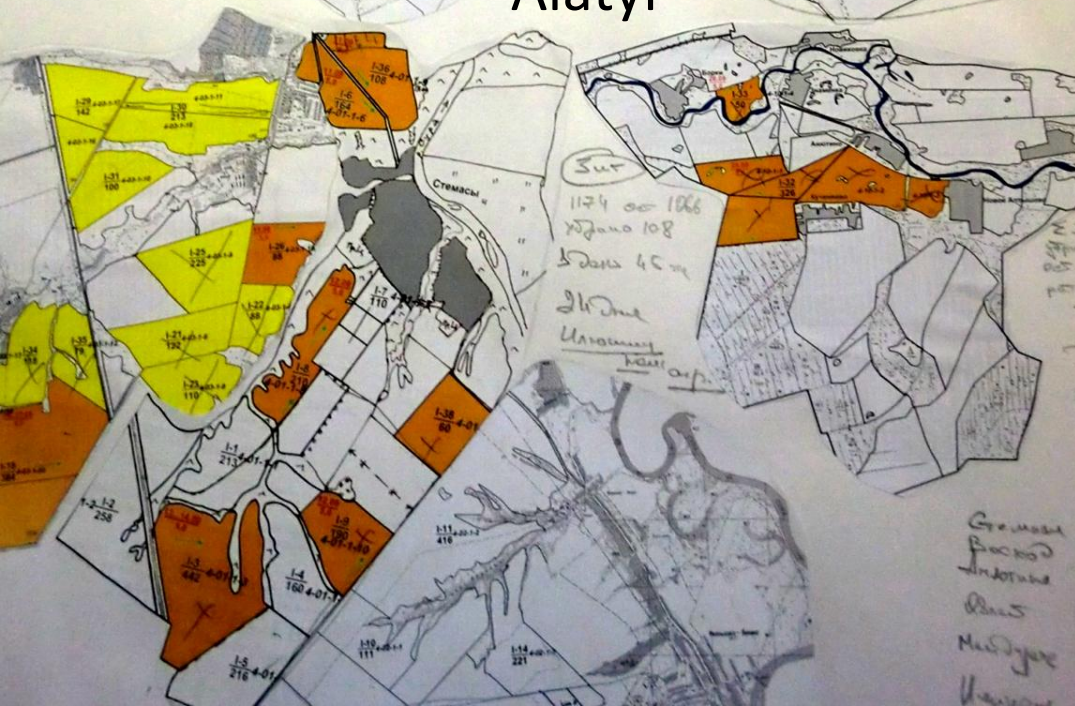

Agriculture in Alatyr rayon – Mordovian agricultural firm

Cultivated Area

1990 – 41k ha

2004 – 0 ha

2010 – 22k ha
