Industrial Sites

Boats

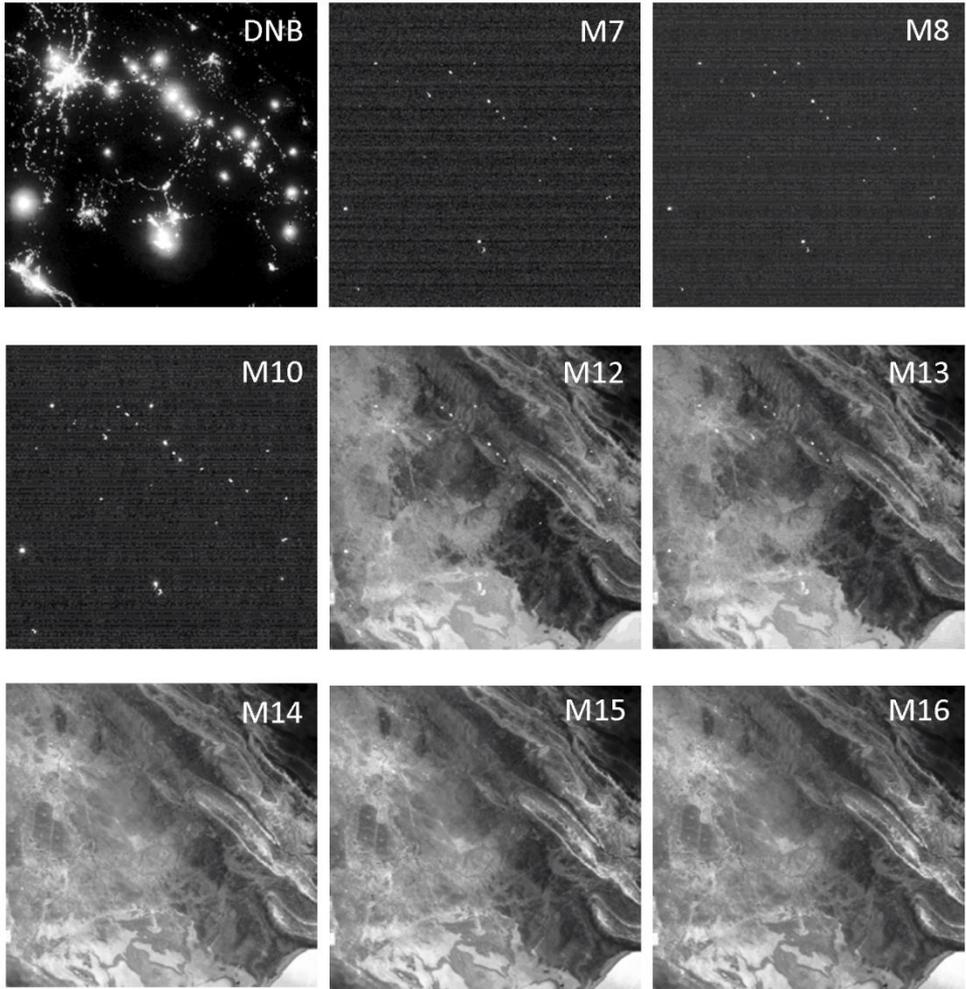

Gas Flares

Fires

The Visible
Infrared
Imaging
Radiometer
Suite
(VIIRS)
primary
mission is
weather.

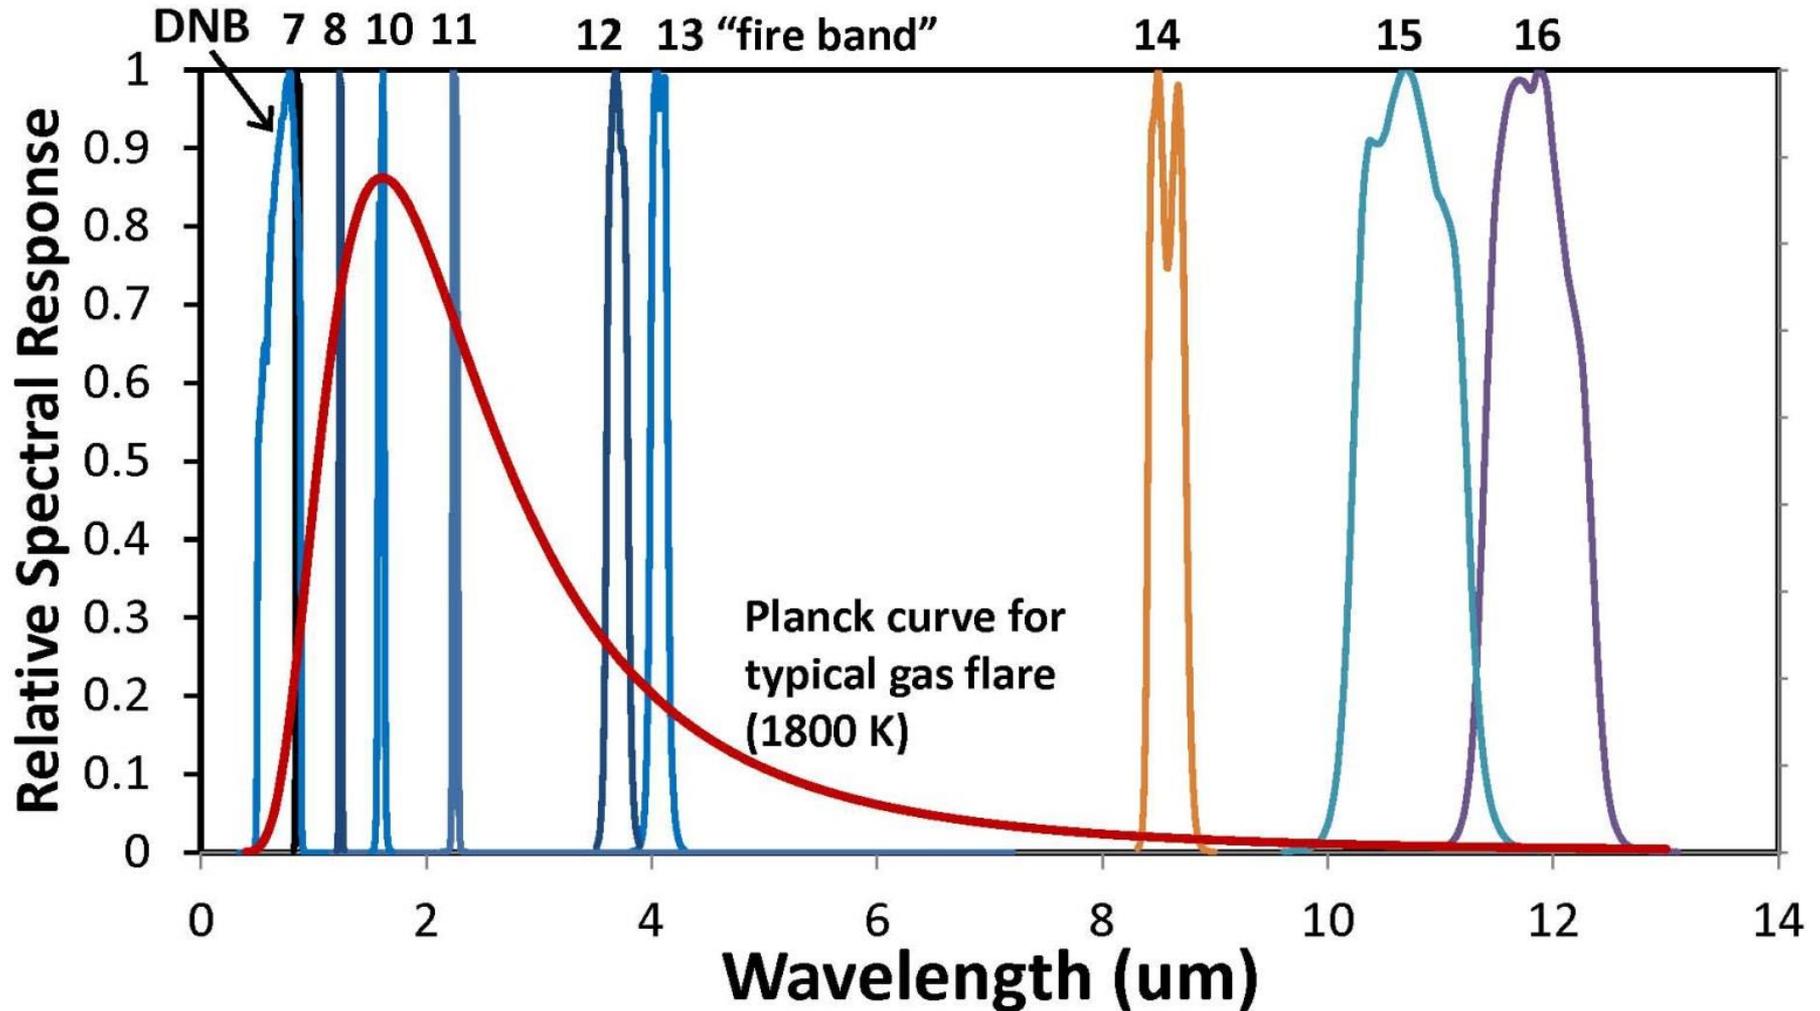

Basra Gas Flares, Iraq - July 17, 2012

VIIRS low light imaging at night:
DNB detects electric lighting, fires and flares.
M7-11 detect combustion sources.

VIIRS Nightfire (VNF): A global multispectral fire product

Nine channels of data collected at night

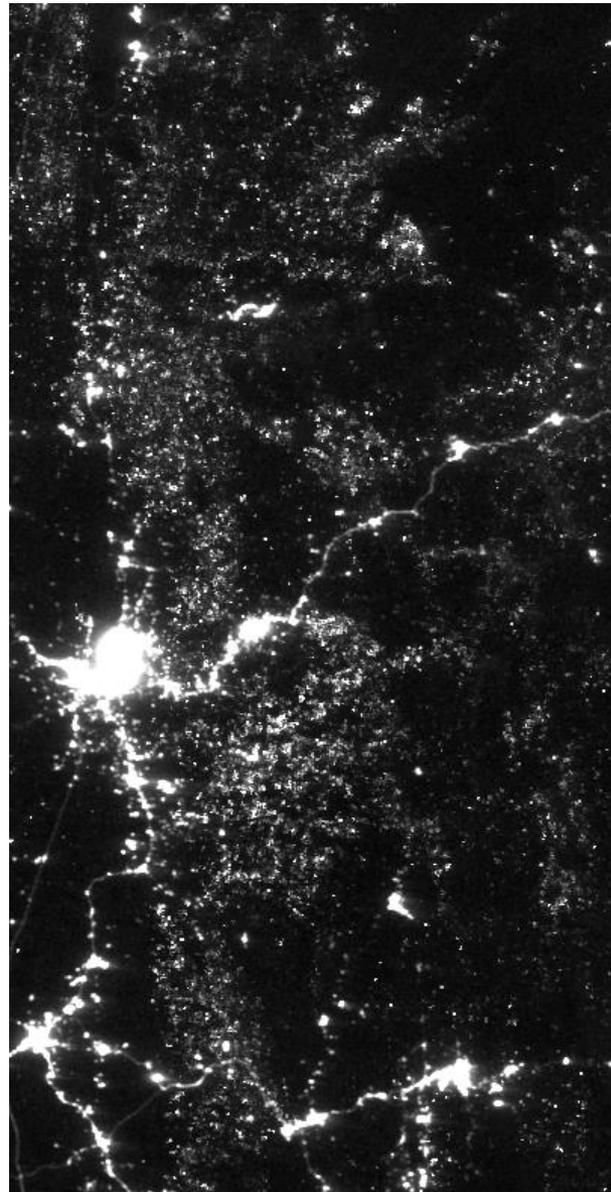

Three global product lines

<https://payneinstitute.mines.edu/eog/>

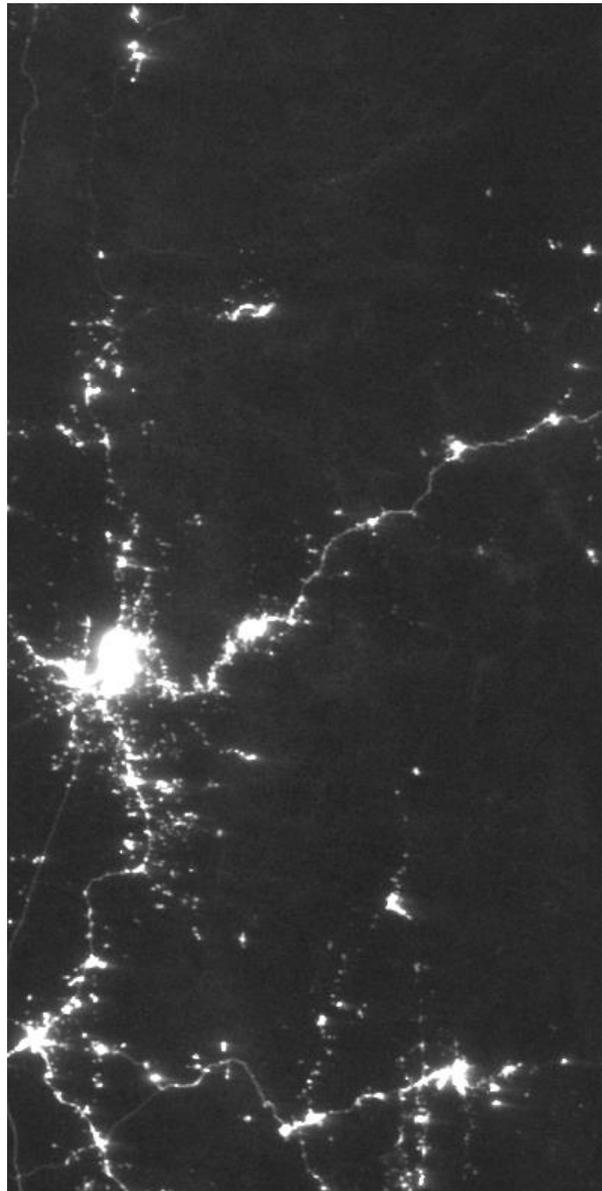

- **VIIRS nighttime lights (VNL):** 1) Monthly cloud-free average DNB radiances, filtered to remove sunlit, moonlit and cloudy pixels. 2) Annual product further filtered to remove fires, aurora, and background.
- **VIIRS boat detections (VBD):** Offshore detections of lights used by fishery agencies. Primarily fishing boats using lights. Four hour temporal latency target.
https://ngdc.noaa.gov/eog/viirs/download_boat.html
- **VIIRS nightfire (VNF):** Multispectral detections of fires, flares and other IR emitters. Calculates temperature, source size and radiant heat using physical laws. Current R&D on subpixel analysis of flaming vs smoldering. Four hour temporal latency target.

VIIRS Nighttime Lights (VNL) 2015 Myanmar

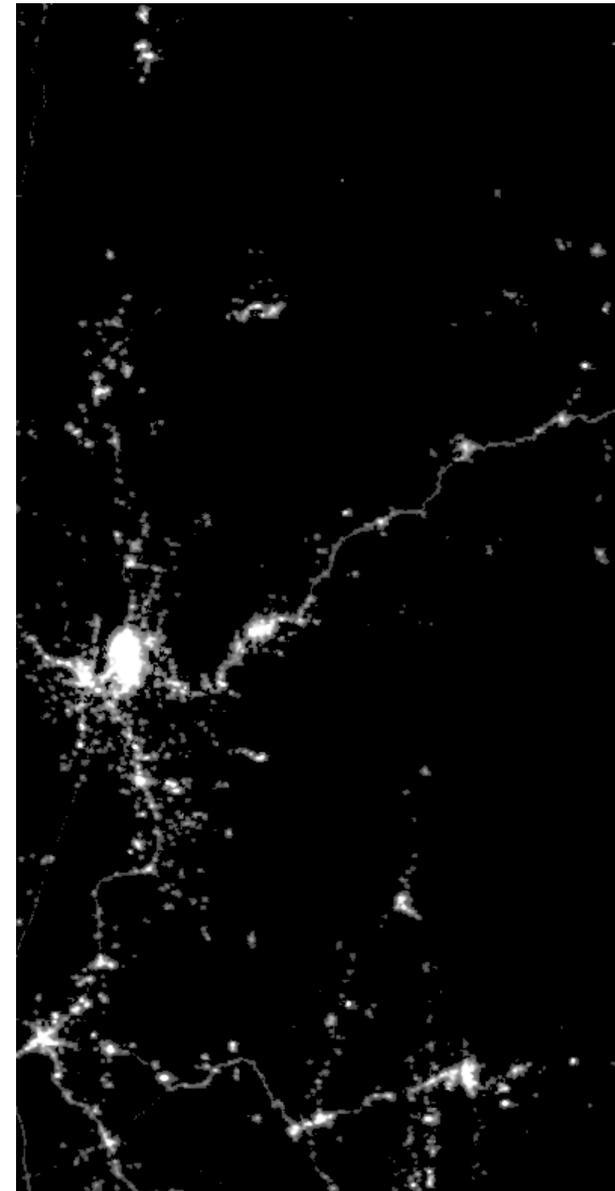

Raw cloud-free composite

Outlier removed

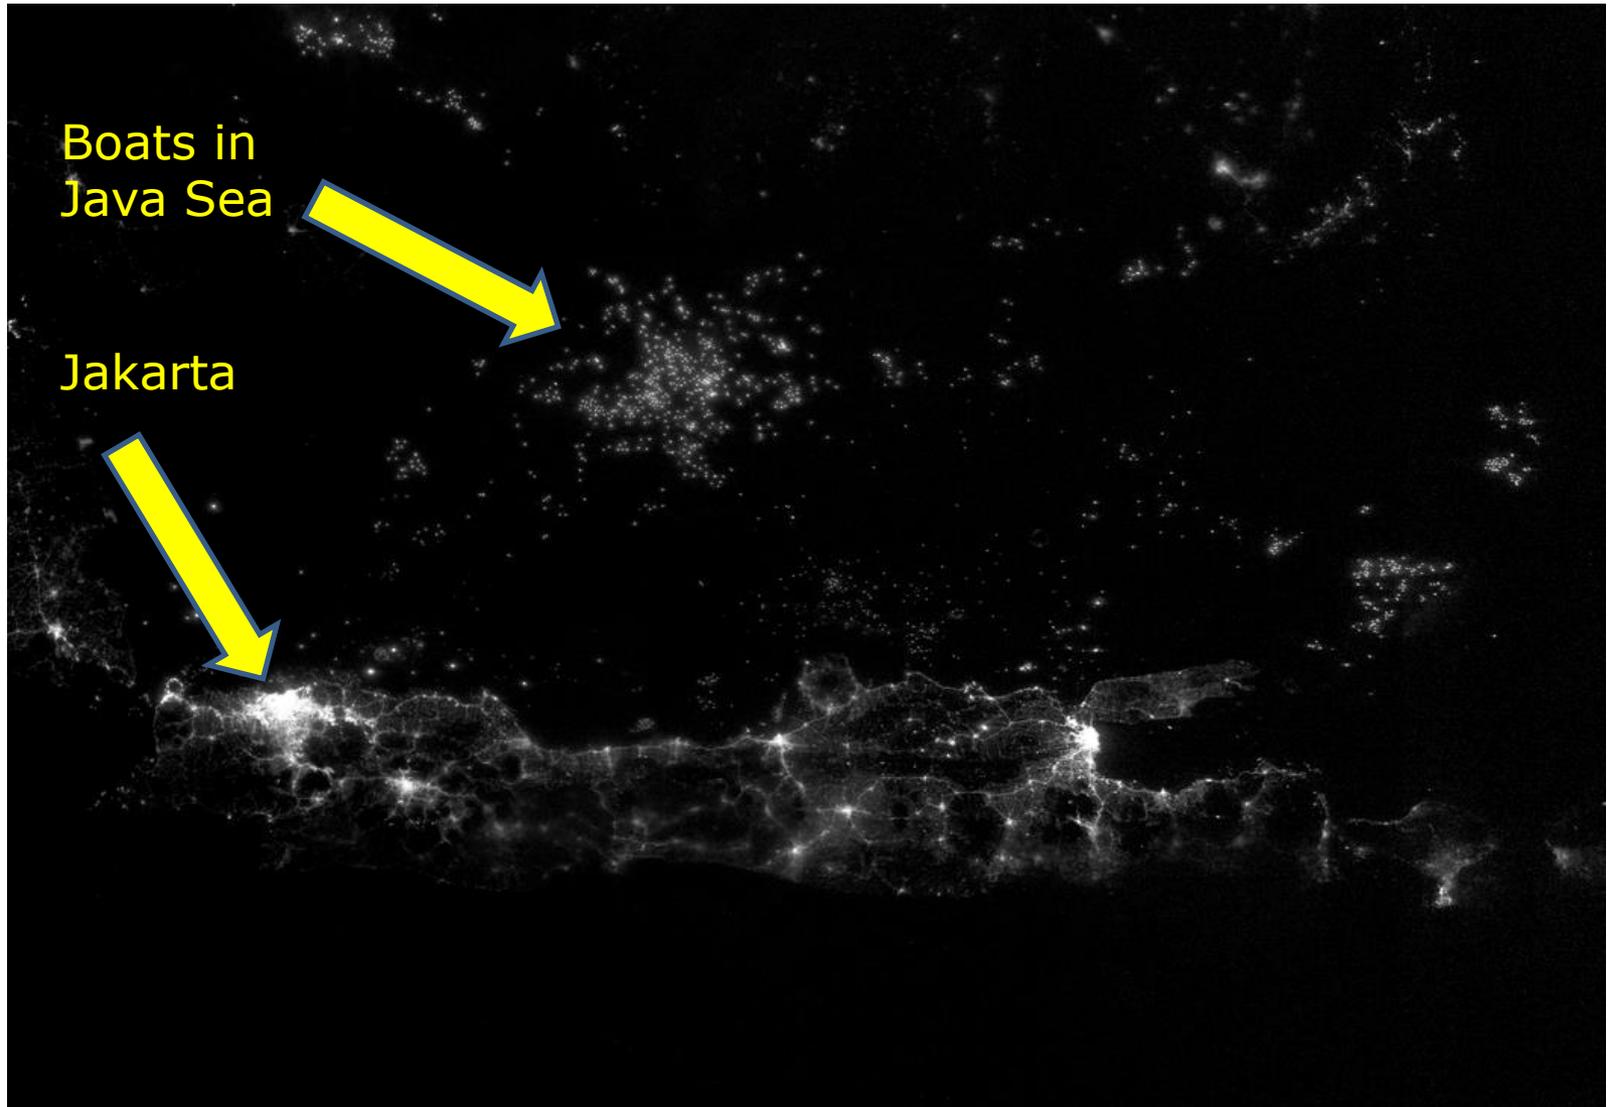

Nighttime lights

Power grid behaviors uncovered by VIIRS in Pakistan. Three months as RGB (Jan. 2013 red, Oct. 2012 green, April 2012 blue).

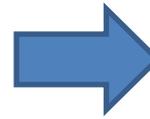

VIIRS boat detection (VBD)

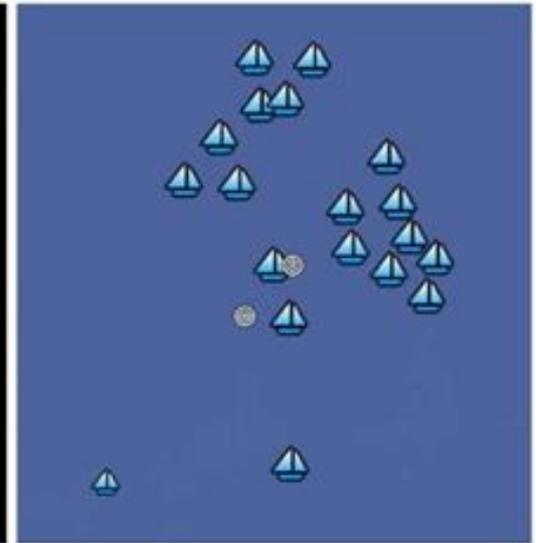

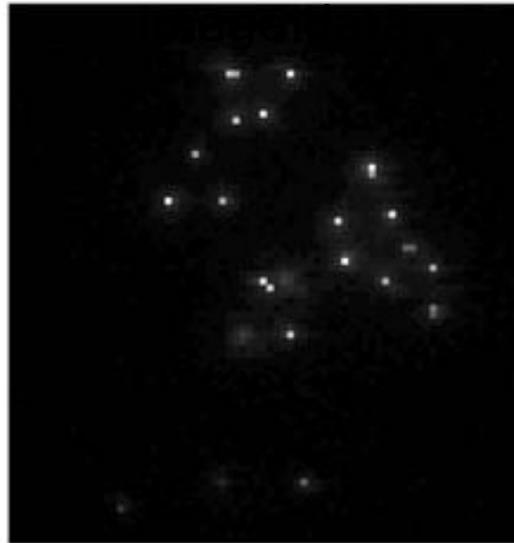

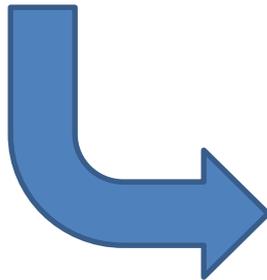

Algorithms run on images, output points, vast data volume reduction

VIIRS
day/night
band (DNB)
nighttime

Boat detection
data (points)

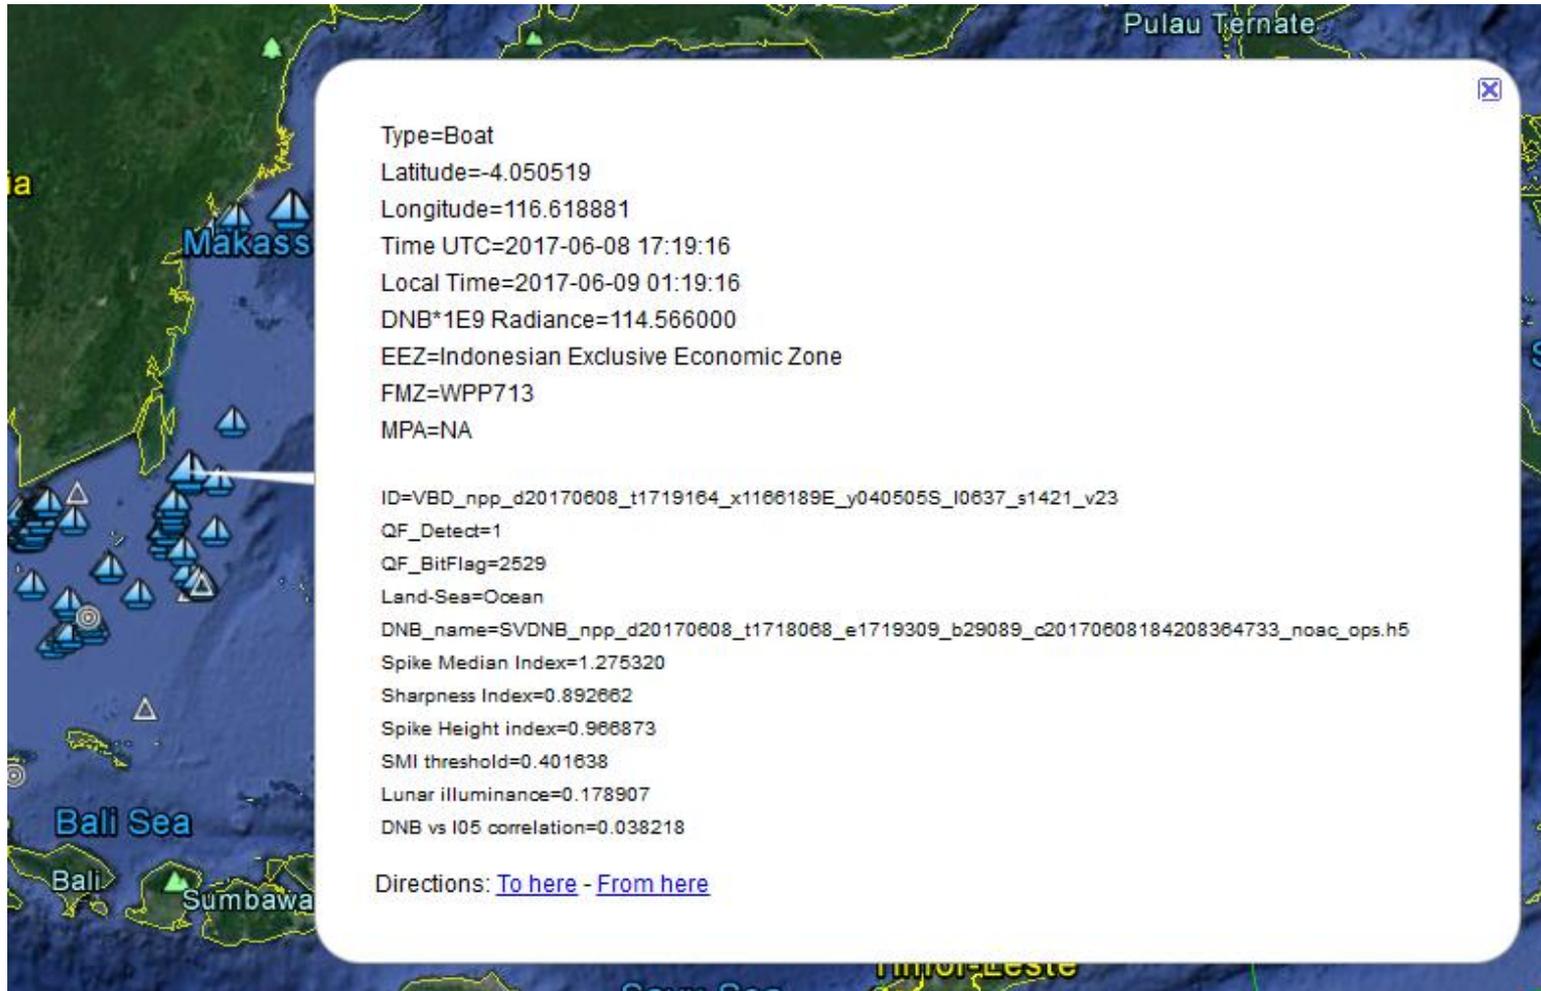

Single Night of Detections (June 9, 2017)

Standard is four hour temporal latency,
with files available at 06:00 local time

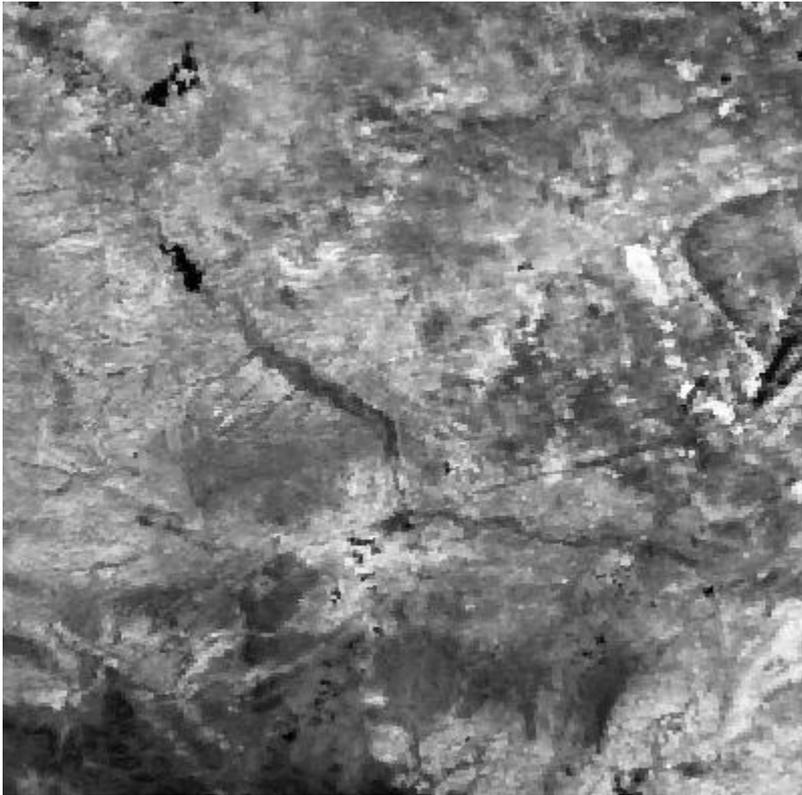

Placemarks sized based on radiance and have information panels

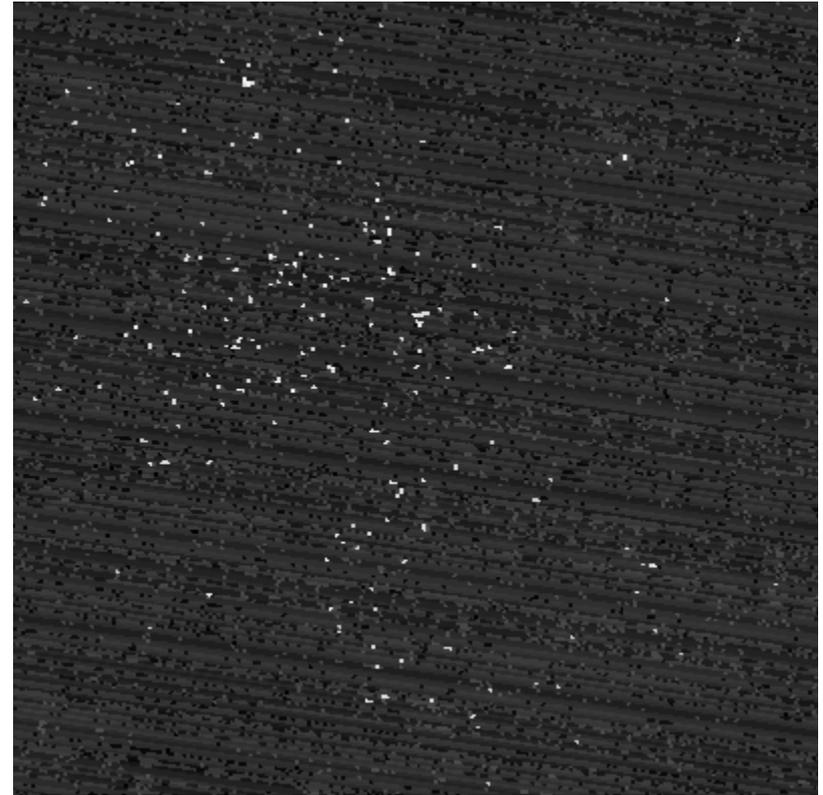

For gas flares – the nighttime is the right time! Bakken Oil Field, North Dakota

Shortwave infrared (1.63 μm) day

Same band, same area, next night

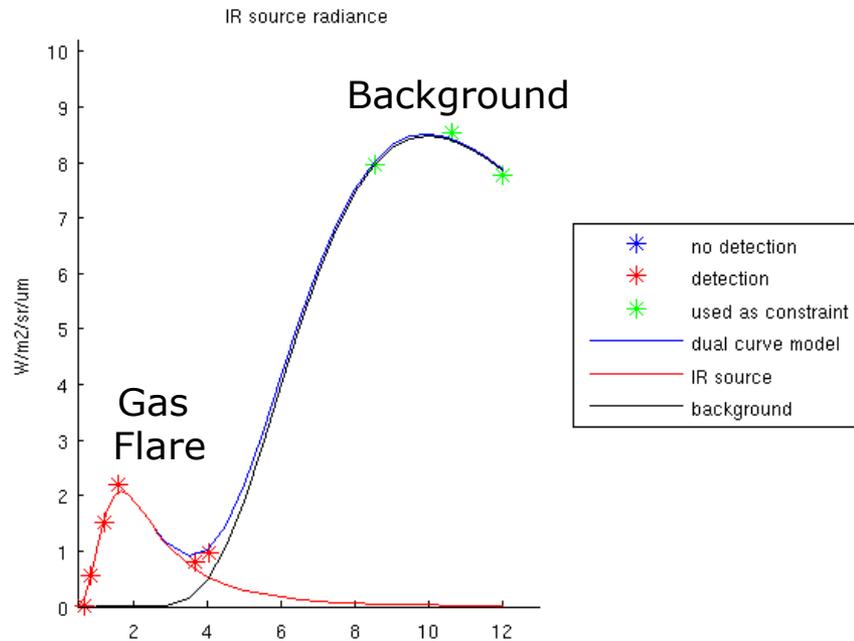

Gas flare peak radiant emissions are near 1.63 micrometers.
The flare radiance is lost during the day due to sunlight.

Why Multispectral?

To get
at the
Planck
curves!

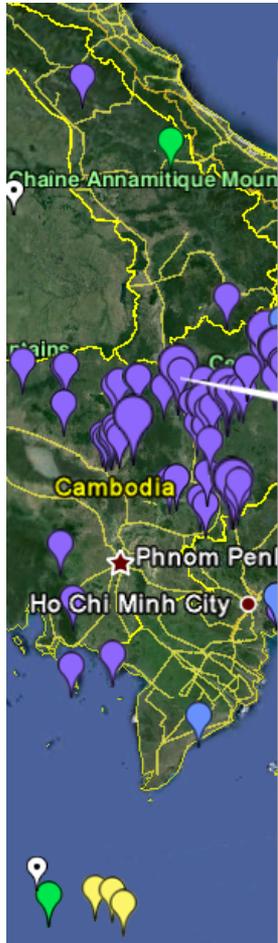

Combustion parameters:

Radiant heat intensity=17.98 W/m² Radiant heat=16.68 MW
Source footprint=373.71 m²
Cloud state=clear Atmosphere corrected=no

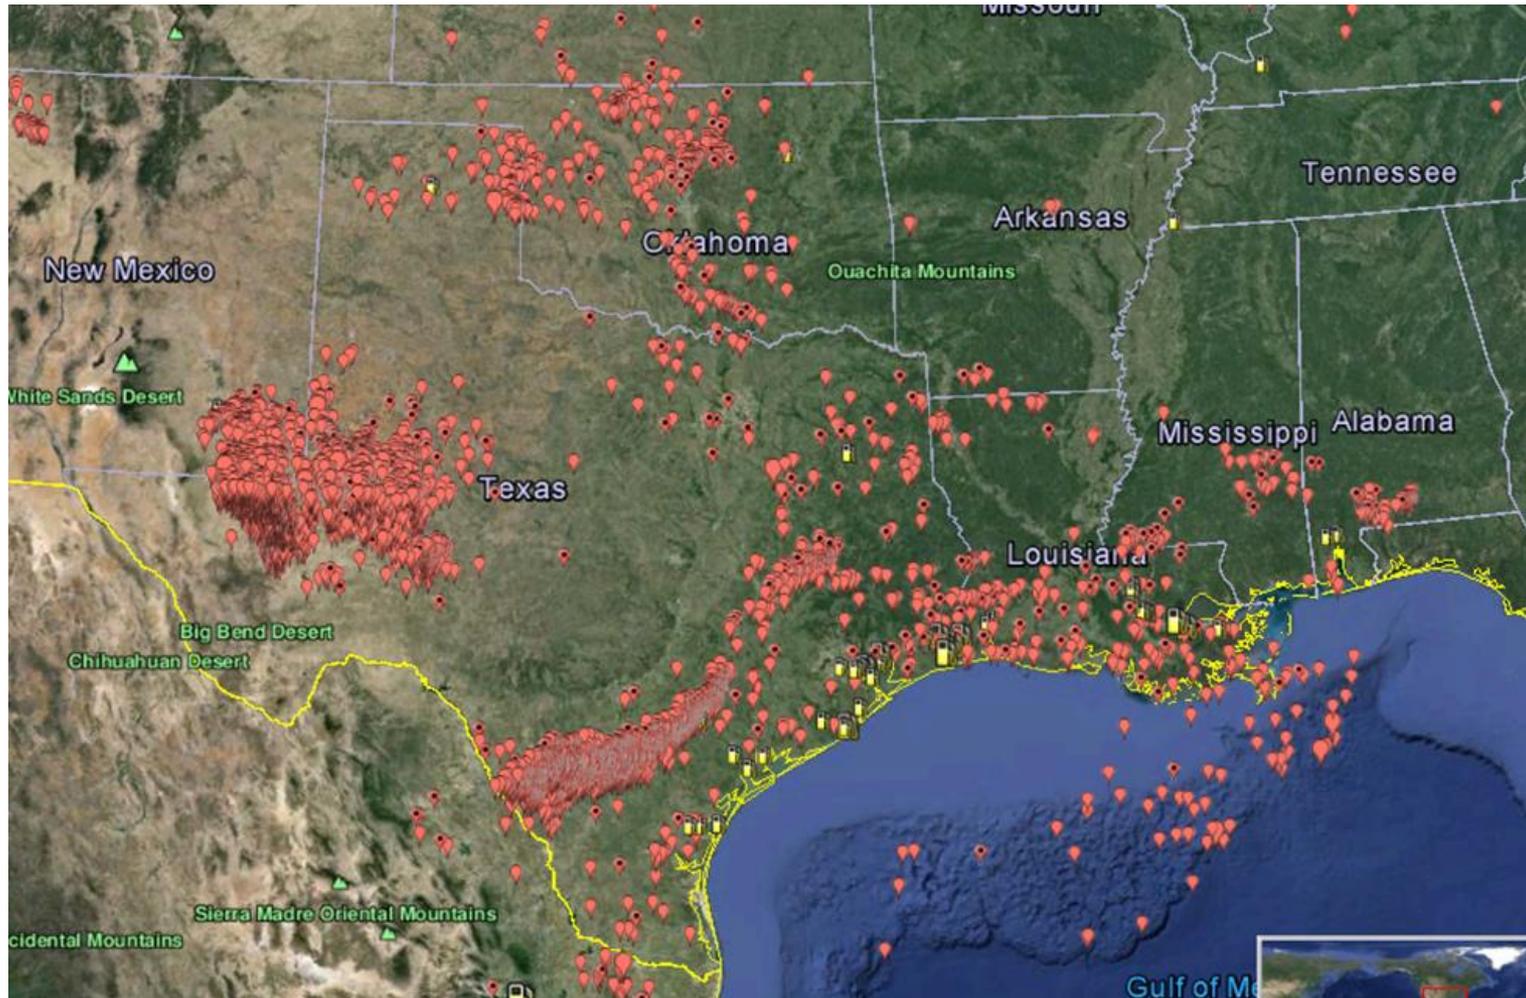

Lower temperature than gas flaring. Often these have larger source size than gas flares.

Temperatures are bimodal

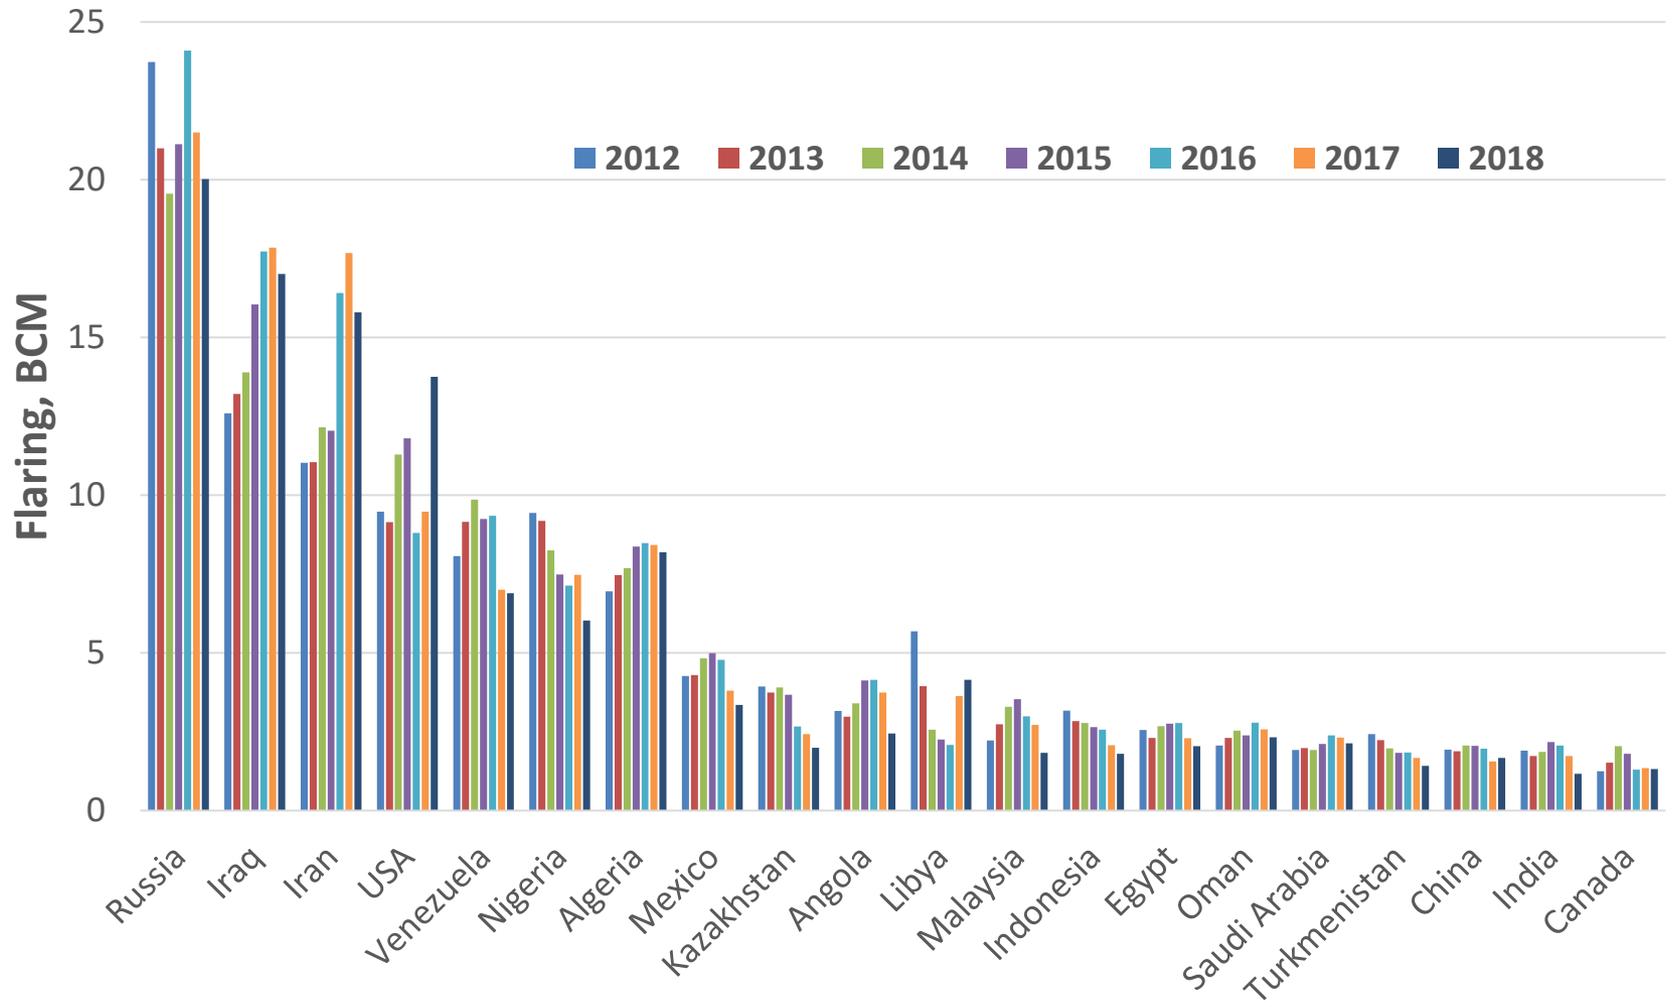

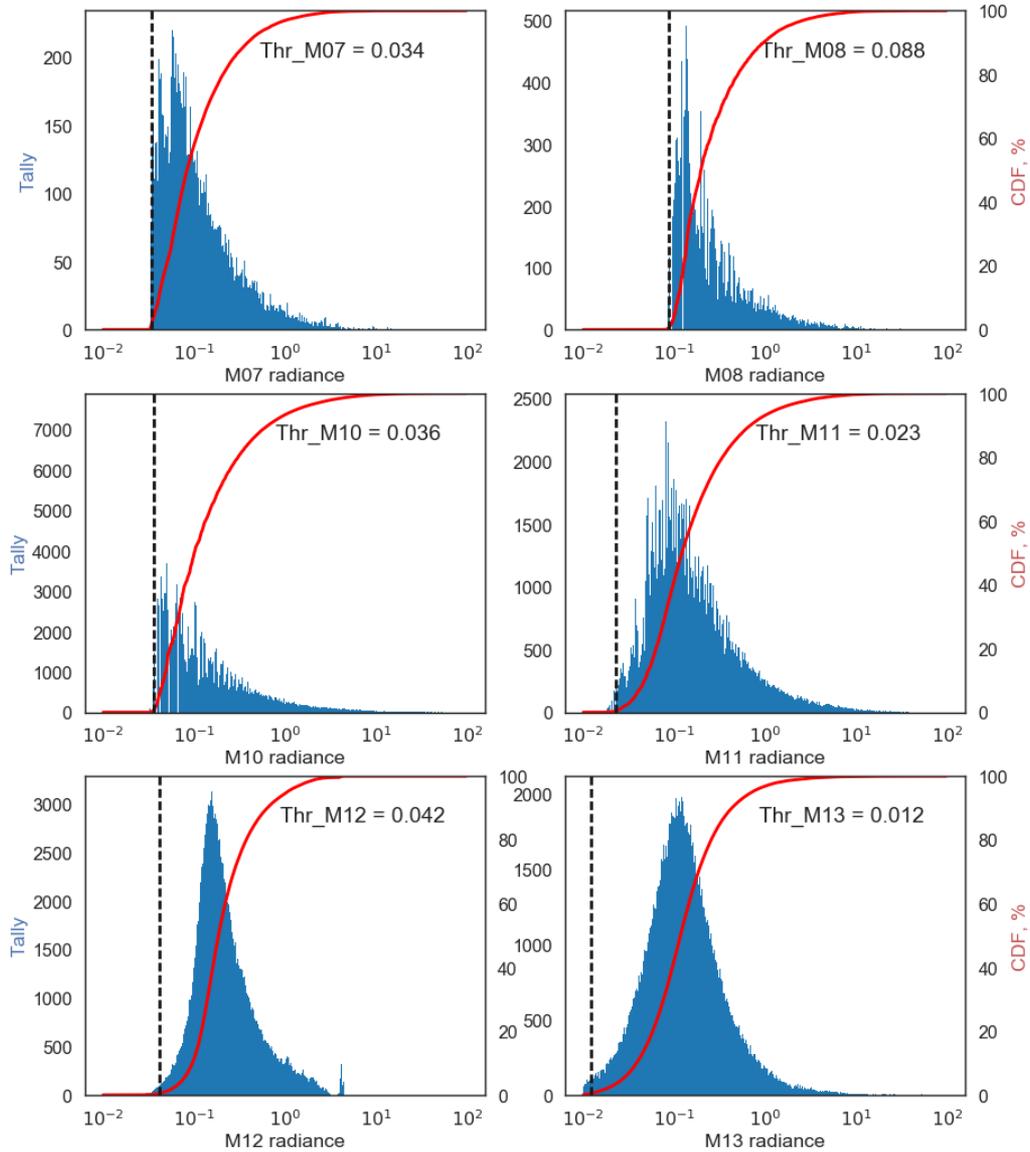

Annual summaries of gas flare locations and gas flare volume estimates are available at:

Upstream Flaring in billions of cubic meters (BCM)

VNF Detection Limits

VNF+ Pixel Types

Type 4 is amenable to flaming vs smoldering analysis

Type	Spectral bands	Fitting	Notes
0	M11	None	Filter out solitary pixels
1	M7, 8, 10, 11	Single Planck curve fitting	Flaming phase combustion – primarily natural gas flares.
2	M11,12,13	Dual Planck curve fitting for IR emitter and background	Flameless glowing embers?
3	M12,13	Dual Planck curve fitting for IR emitter and background	Rare occurrences.
4	M7,8,10,11,12,13	Triple phase fitting for two IR emitters and background	Solve for temperature and source area for a flaming and a cooler combustion phases plus background.
5	M7,8,10,11,12,13	Dual Planck curve fitting for IR emitter and background	Assembled from Type 4 detections that yielded spurious results in triple phase analysis.

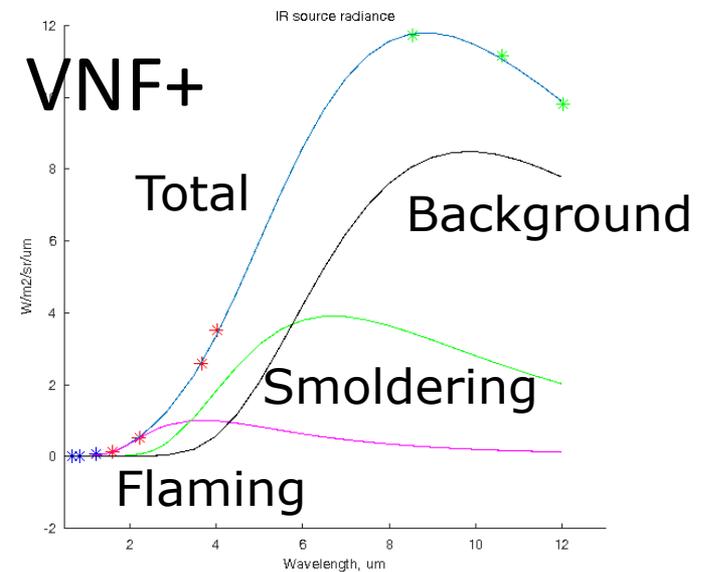

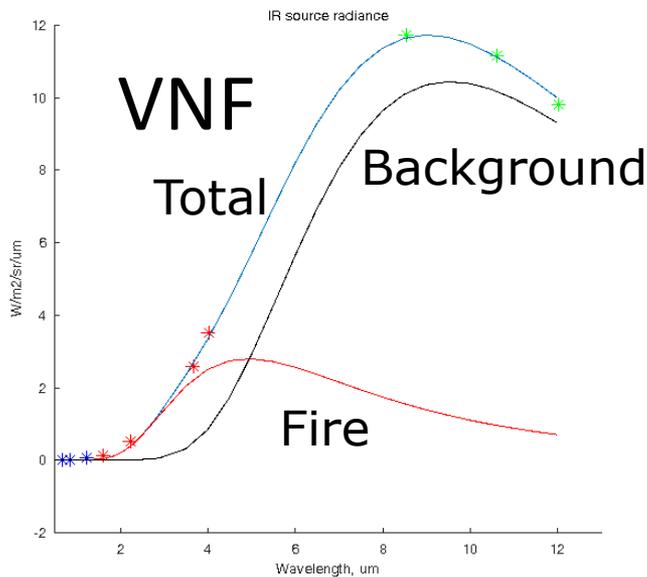

VNF vs VNF+ Peat Fire, Sumatra

plume visible
in Landsat 8
later the
same day.

VNF+ temperature histogram 20190926 Sumatra

Summary: Three global products

- VBD: Nightly VIIRS boat detection (VBD) data is primarily detecting fishing boats using lights to attract catch. This is a common practice in Asia and several other areas. EOG also generates monthly and annual summary grids.
- VNF: VIIRS nightfire is a multispectral fire product reporting temperatures, source sizes and radiant heat. Used for annual global surveys of gas flaring sites and flared gas volumes. Current R&D on flaming versus smoldering subpixel spectral unmixing.
- VIIRS nighttime lights – monthly and annual cloud-free composites of DNB radiances.
