ABSTRACT*

The report discusses how this project will finance a 6-year program to support: (a) forestry works on about 355,000 ha. This will consist of regenerating or afforesting degraded forest areas on about 173,000 ha with multi-tier coverage under

Conversion from rice to typical clonal hybrid Casuarina plantation. The Forest Survey of India notes tree cover > 11,100 km² was added during the period 2001 to 2015.

Green cheer: Forest cover increases in Telugu states

U Sudhakar Reddy | TNN | Feb 13, 2018, 05:52 IST

HYDERABAD: In terms of increase of forest and tree cover, Telangana stood fifth in the country by increasing its tree cover by 565 square kilometres. Neighbouring Andhra Pradesh stood first in the country with the maximum increase of forest and tree cover of over 2,141square kilometres.

gaana of the Day

Figure 3. High resolution Google Earth image (from SPOT) on left; Hansen et al. (2013) forest change product for the same area shown on right with blue showing forest gain and green prior forest extent. Note that most small plantations are not identified (2.5 ha plantation within circled area was identified by our in-country cooperators as a plantation established during the period of the Hansen study).

Analytical approach: theory-guided multi-temporal convolutional neural network

Quality Continuum Land Use Model

Preliminary Results: Forest Plantation Adoption Significantly Associated with Higher Incomes, Ownership Area, and Distance to Market

- Probability that a farmer or household will adopt forest plantations
 - Increases with an increase in distance to the market (Timetomkt) and with income
 - Decreases with an increase in area of land owned
- So far, mostly household level data

5-fold cross-validation
2,230 samples / 5 folds = 446 samples/fold

Results indicate the following:

- (1) the scale of land cover and land use change can be finer than the effective scale of freely-available imagery,**
- (2) forests can be separated from other land cover, and plantation forests from natural forests, but plantation types (palm vs. fiber) are more difficult to discriminate from each other using standard machine learning.**

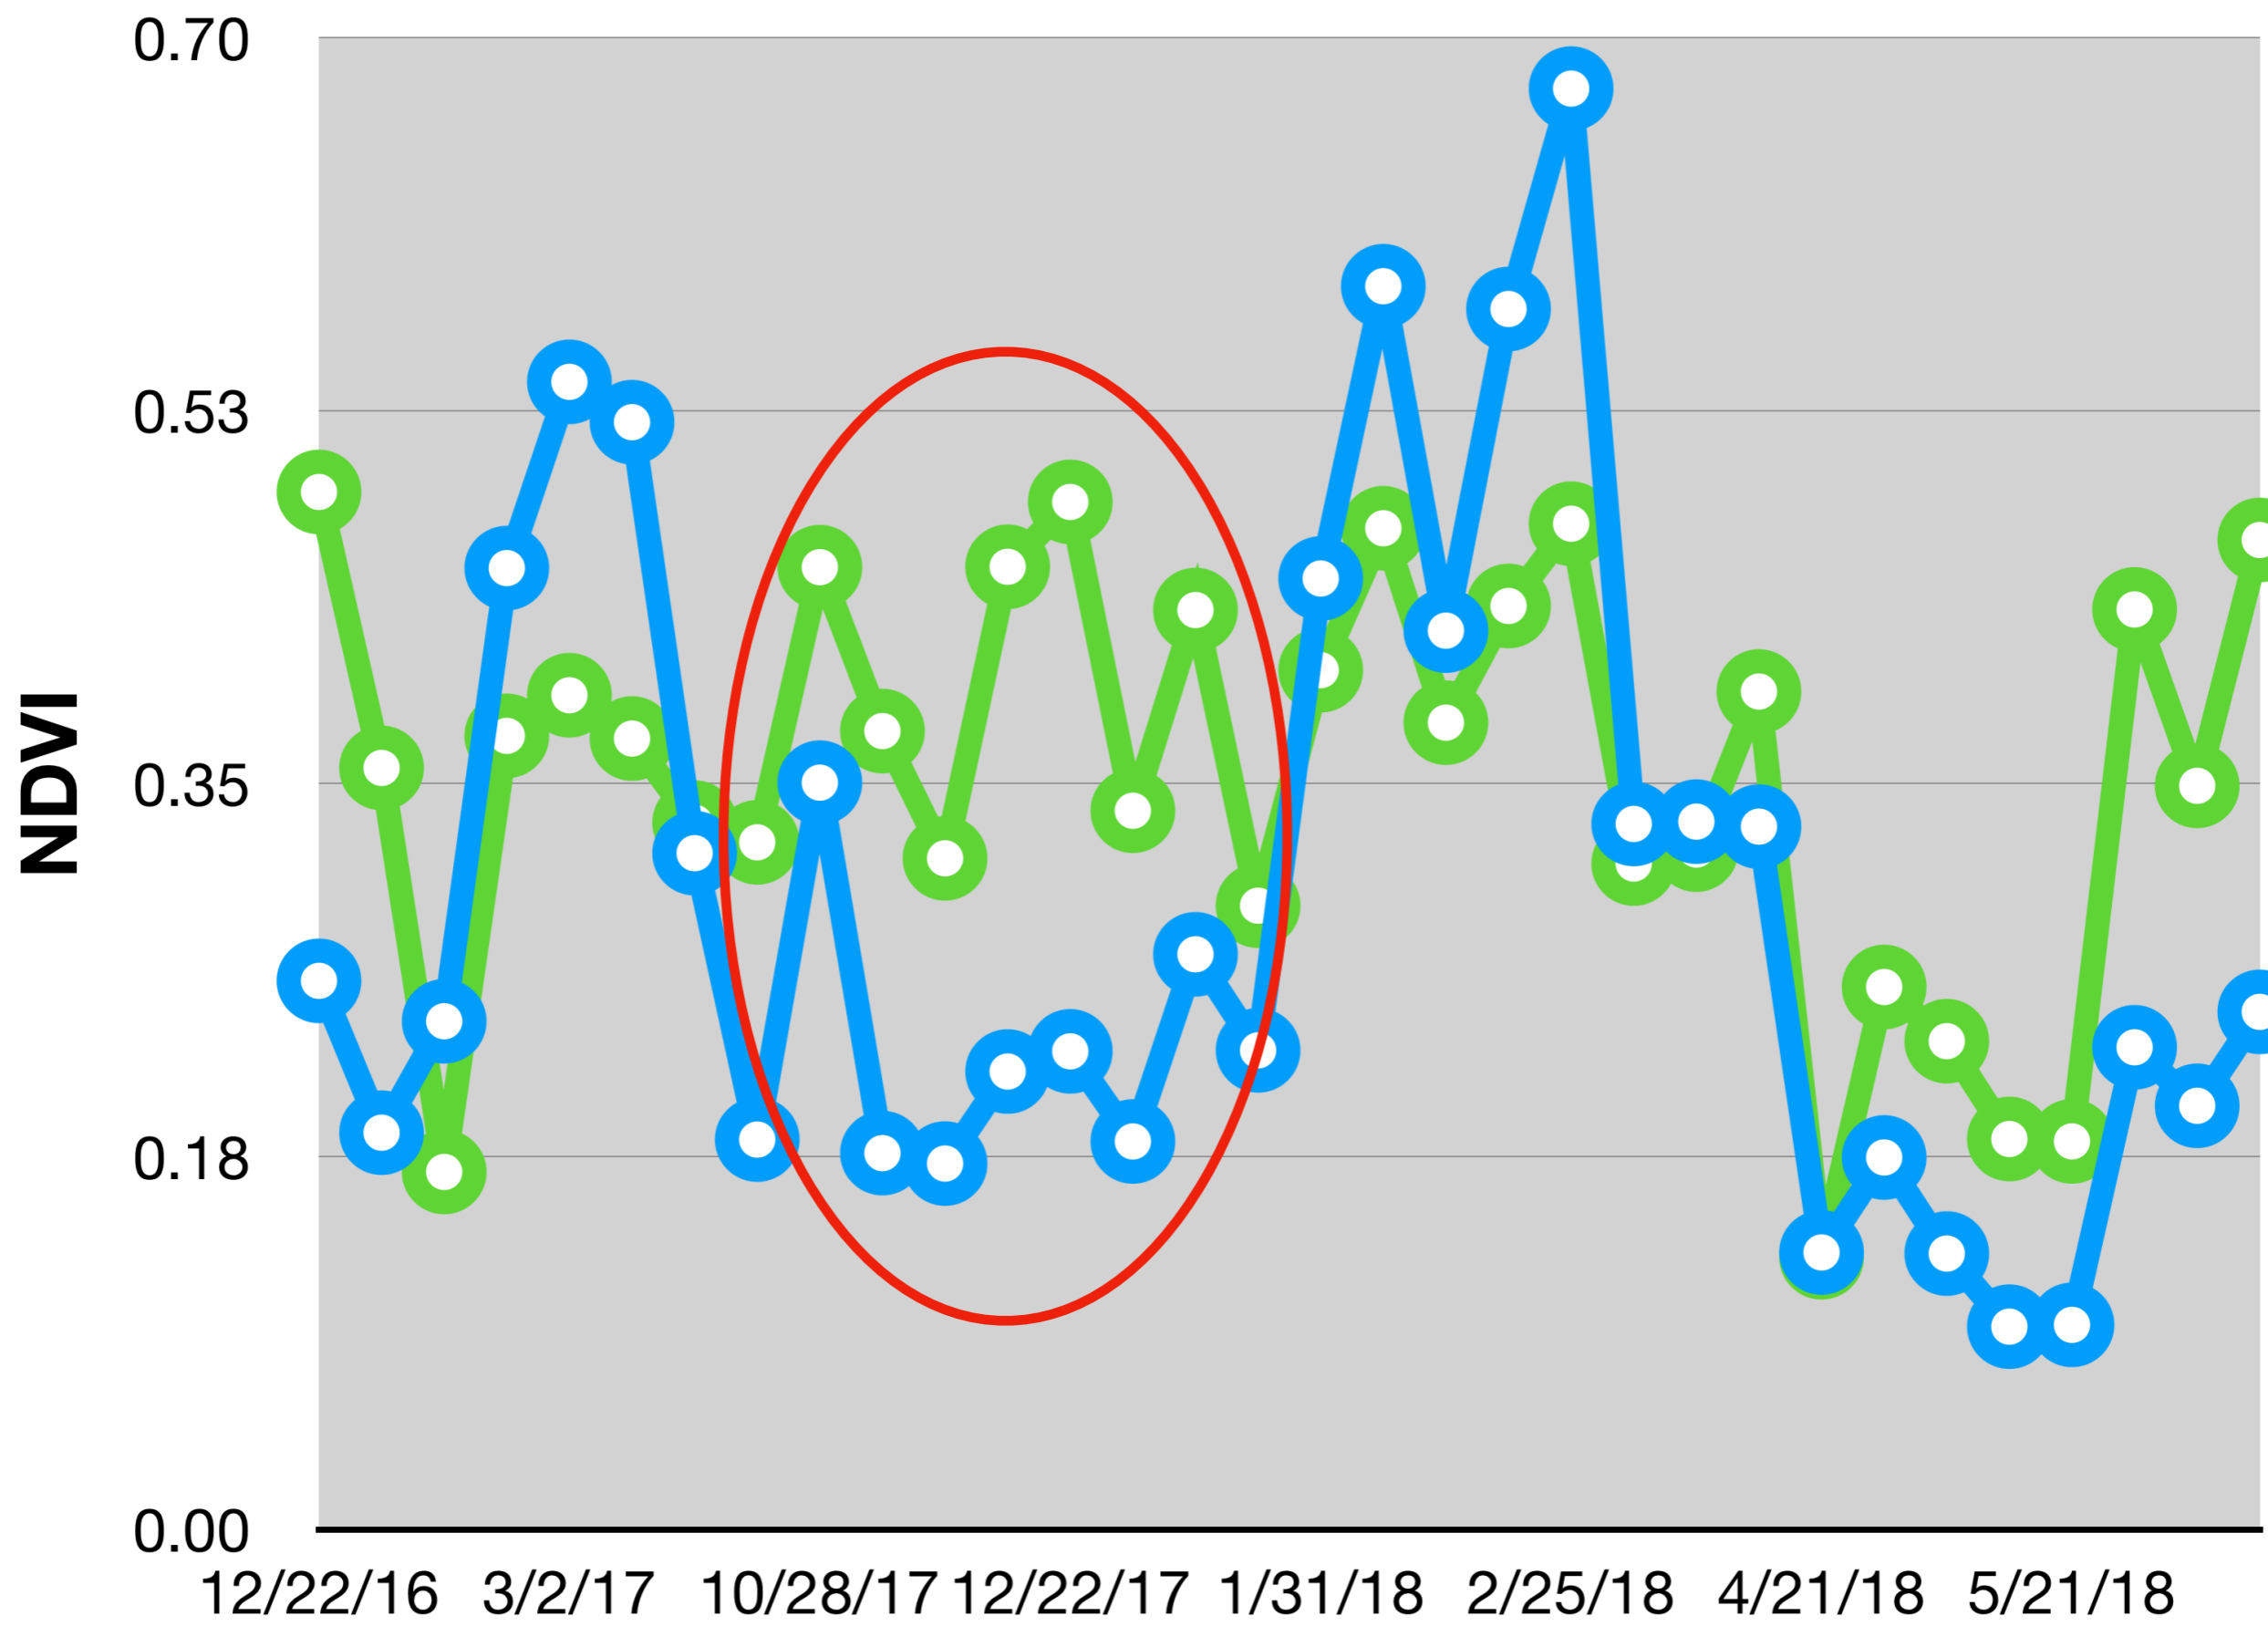

Six Most Important Variables **Winter**, **Annual**, NDVI, and Red

ANDHRA PRADESH

State tops in oil palm cultivation, production

G.V.R. Subba Rao

VIJAYAWADA, DECEMBER 10, 2018 00:32 IST

UPDATED: DECEMBER 10, 2018 00:32 IST

[Andhra Pradesh](#) stands first in the country in oil palm cultivation and production covering an area of 1.62 lakh hectare with a yield of 14.09 lakh metric tons (MTs) of fresh fruit bunches (FFBs). The average productivity stands at 19.81 tons per hectare from the bearing plantations. Apart from attractive returns and the government's oil palm development programme etc., '**absentee landlordism**' is also said to be one of the reasons behind farmers taking up cultivation of oil palm.

According to information, thousands of farmers in the State are cultivating oil palm for various reasons including returns per acre and very less incidence of pest and disease compared to other crops. In addition, inter-crops like cocoa, pepper and vegetables can also be taken up. **About 1.14 lakh farmers are into oil palm cultivation.** On an average, the farmers are getting a net income of ₹40,000 to ₹50,000 per acre from oil palm crop, horticulture officials say.

Deep Learning for Forest Plantation Mapping in Godavari Districts of Andhra Pradesh, India

Snehal More^{1*}, Anuj Karpatne², Randolph H. Wynne¹, Valerie A. Thomas¹

Conclusions

- HLS S10 data, across years, were vital.
- High-quality, field-verified, classification training data were, as always, essential.
- Smallholders have fine-scale, temporally-variable, and complex combinations of crops and forests in many parts of the world, and the lessons learned from AP have regional to global applicability.

Science of Remote Sensing is an open-access, peer-reviewed journal focused on high impact science and applications using state-of-the-art remote sensing techniques.

Science and application themes include the following:

- Earth science
- Limnology, oceanography, hydrology
- Land cover and land...

Feedback

Mission:

Three SAFE SmallSat buses for diurnal sampling of forest structure and function 3 hour on-orbit temporal separation of SmallSats

Orbit: ~700 km, sun synch, equator crossing time at 1300, 1630 hours

Data:

Daytime, growing season (all year in tropics).

Spectral radiance for PRI, LUE and pigments.

Stereo triplet images for 3D structure and shadow correction.

Flux towers for calibration.

Instruments:

Stereo camera (Visible Pan) for structure, 1m res, 30 km swath
VSWIR (400-1700nm) for forest functioning. 10-20nm bandwidth, 30m resolution, 30km swath

Science Products:

Hi-res 3D canopy height models

Diurnal/Seasonal Canopy:
